5.4.1 Unconditional Branch (GO TO statement) ..... 138
5.4.2 Conditional Branch (IF statement) ..... 138
5.4.3 Conditional Expression ..... 139
5.4.4 Repetition (WHILE Statement) ..... 140
5.5 Macro Statement and NC statement ..... 141
5.5.1 Macro Programming and Registering ..... 141
5.5.2 Limitation ..... 141
CHAPTER 6 CUTTER COMPENSATION ..... 142
6.1 Application for Cutter Radius Compensation ..... 142
6.1.1 Brief ..... 142
6.1.2 Compensation value setting ..... 142
6.1.3 Command format ..... 143
6.1.4 Compensation direction ..... 143
6.1.5 Caution ..... 144
6.1.6 Example for application ..... 144
6.2 Offset Path Explanation for Cutter Radius Compensation ..... 145
6.2.1 Conception for inner side or outer side ..... 145
6.2.2 Tool movement in start-up ..... 146
6.2.3 Tool movement in offset mode ..... 147
6.2.4 Tool operation in offset cancellation mode. ..... 152
6.2.5 Interference check ..... 154
6.2.6 Command of compensation vector cancel temporarily ..... 156
6.2.7 Exceptional case ..... 157

## Volume II OPERATION

CHAPTER1 OPERATION MODE AND DISPLAY ..... 163
1.1 Panel Division. ..... 163
1.1.1 State indication ..... 164
1.1.2 Edit keypad. ..... 164
1.1.3 Menu display ..... 165
1.1.4 Machine panel ..... 166
1.2 Summary of Operation Mode ..... 169
1.3 Display Interface ..... 170
1.3.1 Position interface ..... 173
1.3.2 Program interface ..... 175
1.3.3 Tool offset, macro variable and tool life management interface. ..... 177
1.3.4 Alarm interface ..... 181
1.3.5 Setting interface ..... 183
1.3.6 BIT PARAMETER, DATA PARAMETER, PITCH COMP interface ..... 188
1.3.7 CNC DIAGNOSIS, PLC STATE, PLC VALUE, machine soft panel, VERSION MESSAGE interface ..... 190
1.4 List of general operations ..... 193
CHAPTER 2 POWER ON OR OFF AND PROTECTION ..... 199
2.1 System Power On ..... 199
2.2 System Power Off. ..... 199
2.3 Overtravel Protection ..... 200
2.3.1 Hardware overtravel protection ..... 200
2.3.2 Software overtravel protection ..... 200
2.4 Emergency Operation ..... 200
2.4.1 Reset ..... 201
2.4.2 Emergency stop ..... 201
2.4.3 Feed hold ..... 201
2.4.4 Power off ..... 201
CHAPTER 3 MANUAL OPERATION ..... 202
3.1 Coordinate axis moving ..... 202
3.1.1 Manual feed ..... 202
3.1.2 Manual rapid traverse ..... 202
3.1.3 Manual feedrate override adjustment ..... 203
3.1.4 Manual rapid override adjustment .....  204
3.1.5 Relative coordinate clearing ..... 204
3.2 Other Manual operations ..... 205
3.2.1 Spindle CCW, CW, stop control ..... 205
3.2.2 Spindle Jog ..... 205
3.2.3 Cooling control ..... 205
3.2.4 Lubrication control ..... 205
3.2.5 Spindle override adjustment ..... 206
CHAPTER 4 MPG/STEP OPERATION ..... 207
4.1 Step Feed ..... 207
4.1.1 Increment selection ..... 207
4.1.2 Moving direction selection ..... 208
4.2 MPG (Handwheel) Feed ..... 208
4.2.1 Increment selection ..... 208
4.2.2 Moving axis and direction selection ..... 209
4.2.3 Explanation items ..... 209
CHAPTER 5 MDI OPERATION ..... 210
5.1 Code Words Input ..... 210
5.2 Code Words Execution ..... 211
5.3 Parameter Setting ..... 212
5.4 Data Modification ..... 212
5.5 OUT Key Start ..... 213
CHAPTER 6 PROGRAM EDIT AND MANAGEMENT ..... 215
6.1 Program Creation ..... 215
6.1.1 Creation of the block number ..... 215
6.1.2 Input of the program content ..... 215
6.1.3 Search of the character ..... 217
6.1.4 Insertion of the character ..... 219
6.1.5 Deletion of the character ..... 221
6.1.6 Modification of the character ..... 221
6.1.7 Deletion of a single block ..... 221
6.1.8 Deletion of the blocks ..... 221
6.1.9 Segment deletion ..... 223
6.2 Program annotation ..... 224
6.2.1 Annotation for program name ..... 224
6.2.2 Block annotation ..... 226
6.2.3 Alter program annotation ..... 226
6.3 Deletion of the Program ..... 226
6.3.1 Deletion a single program ..... 226
6.3.2 Deletion of all programs ..... 227
6.4 Selection of the Program ..... 227
6.4.1 Search method ..... 227
6.4.2 Scanning method ..... 228
6.4.3 Cursor method ..... 228
6.4.4 Select file by using file list ..... 228
6.5 Execution of the Program ..... 229
6.6 Rename of the Program ..... 229
6.7 Copy of the Program ..... 229
6.8 Program positioning ..... 230
6.9 Program preview ..... 230
CHAPTER 7 AUTO OPERATION ..... 232
7.1 Auto Run ..... 232
7.1.1 Selection of the program to be run ..... 232
7.1.2 Program start ..... 233
7.1.3 Stop of the auto run ..... 233
7.1.4 Auto run from an arbitrary block ..... 235
7.1.5 Adjustment of the feedrate override, rapid override ..... 236
7.1.6 Spindle override adjustment ..... 237
7.2 DNC running ..... 237
7.3 Running state ..... 237
7.3.1 Single block execution ..... 237
7.3.2 Dry run ..... 238
7.3.3 Machine lock ..... 238
7.3.4 MST lock ..... 238
7.3.5 Block skip ..... 239
7.3.6 Optional stop ..... 239
7.4 Memorizing at power-down ..... 239
7.4.1 Program interruption in non-DNC auto operation ..... 239
7.4.2 Interruption at power-down on DNC auto operation ..... 240
CHAPTER 8 MACHINE ZERO RETURN OPERATION ..... 241
8.1 Machine Zero ..... 241
8.2Machine Zero Return Steps ..... 241
CHAPTER 9 DATA SETTING, BACKUP and RESTORE ..... 243
9.1 Data Setting ..... 243
9.1.1 Switch setting ..... 243
9.1.2 Graphic setting ..... 243
9.1.3 Parameter setting ..... 245
9.2 The Password Setting and Alteration ..... 251
9.2.1 Entry of the operation level ..... 252
9.2.2 Alteration of the password ..... 253
9.2.3 Lower level set ..... 254
9.3 Data Restore and Backup ..... 256
CHAPTER 10 ADVANCE OPERATION ..... 258
10.1 Operation path ..... 258
10.2 Operation instructions ..... 260
10.3 Attentions ..... 261
CHAPTER 11 FLASH OPERATION ..... 262
11.1. File list ..... 262
11.2. Introduction of general file operation function ..... 263
11.2.1 Open and close file folder ..... 263
11.2.2 Copy the file by one key(current list in C disk $\longleftrightarrow$ current list in U disk) ..... 264
11.2.3 CNC file search ..... 265
11.2.4 Open CNC file ..... 266

## VOLUME III INSTALLATION

CHAPTER 1 INSTALLATION LAYOUT ..... 271
1.1 GSK980MDa Connection ..... 271
1.1.1 GSK980MDa back cover interface layout ..... 271
1.1.2 Interface explanation ..... 271
1.2 GSK 980 MDa Installation ..... 272
1.2.1 GSK980MDa external dimensions ..... 272
1.2.2 Installation conditions of the cabinet ..... 272
1.2.3 Protection methods against interference ..... 272
2.1 Connection to Drive unit ..... 275
2.1.1 Drive interface definition ..... 275
2.1.2 Command pulse and direction signals ..... 275
2.1.3 Drive unit alarm signal ..... 275
2.1.4 Axis enable signal ENn ..... 276
2.1.5 Pulse disable signal SETn ..... 276
2.1.6 Zero signal nPC ..... 276
2.1.7 Connection to drive unit ..... 277
2.2 Connection of 4th axis ..... 278
2.2.1 4th axis interface definition ..... 278
2.2.2 Connection of $4^{\text {th }}$ axis interface as linear axis ..... 279
2.2.3 Connection of $4^{\text {th }}$ axis interface as rotary axis ..... 280
2.3 Connection of spindle port ..... 280
2.3.1 Definition of signal ..... 280
2.3.2 Spindle zero signal ..... 280
2.3.3 Linear axis. ..... 281
2.3.4 Connected with inverter ..... 281
2.3.5 Connection of spindle interface as rotary axis ..... 282
2.3.6 Connection of spindle interface as "CS" axis ..... 282
2.3.7 SVC Signal explanation ..... 282
2.4 Connection to Spindle Encoder ..... 283
2.4.1 Spindle encoder interface definition ..... 283
2.4.2 Signal Explanation ..... 283
2.4.3 Connection of spindle encoder interface ..... 283
2.5 Connection to Handwheel ..... 284
2.5.1 Handwheel interface definition ..... 284
2.5.2 Signal explanation ..... 284
2.6 Connection of GSK980MDa to PC ..... 285
2.6.1 Communication interface definition ..... 285
2.6.2 Communication interface connection ..... 285
2.7 Connection of Power Interface ..... 286
2.8 I/O Interface Definition: ..... 287
2.8.1 Input Signal ..... 287
2.8.2 Output signal ..... 289
2.9 Machine Zero ..... 290
CHAPTER 3 PARAMETER ..... 299
3.1 Parameter Description (by sequence) ..... 299
3.1.1 Bit parameter. ..... 299
3.1.2 Data parameter ..... 308
3.2 Parameter description (by function sequence) ..... 314
3.2.1 Axis control logic ..... 314
3.2.2 Acceleration \& deceleration control ..... 316
3.2.3 Machine protection ..... 317
3.2.4 Thread function ..... 318
3.2.5 Spindle control ..... 318
3.2.6 Tool function ..... 319
3.2.7 Edit and Display ..... 320
3.2.8 Precision compensation ..... 320
3.2.9 Communication setting ..... 321
3.2.10 Machine zero return ..... 322
3.2.11 Rotary axis function ..... 325
4.1 Emergency Stop and Stroke Limit ..... 328
4.2 Drive unit Unit Setting. ..... 328
4.3 Gear Ratio Adjustment ..... 329
4.4 Acceleration\&deceleration Characteristic Adjustment. ..... 330
4.5 Machine Zero Adjustment ..... 332
4.6 Spindle Adjustment. ..... 333
4.6.1 Spindle encoder ..... 333
4.6.2 Spindle brake ..... 333
4.6.3 Switch volume control of spindle speed ..... 334
4.6.4 Analog voltage control for spindle speed. ..... 334
4.7 Backlash Offset ..... 334
4.8 Step/MPG adjustment ..... 335
4.9 Other Adjustment. ..... 336
CHAPTER 5 DIAGNOSIS MESSAGE ..... 337
5.1 CNC Diagnosis ..... 337
5.1.1 Signal diagnosis from machine to CNC ..... 337
5.1.2 Axes moving state and data diagnosis signal of CNC ..... 337
5.1.3 MDI panel keys diagnosis. ..... 338
5.1.4 CNC internal state ..... 339
5.2 PLC state ..... 340
5.2.1 X address (fixed addresses). ..... 340
5.2.2 Y address (fixed addresses). ..... 342
5.3 PLC Data ..... 342
CHAPTER 6 MEMORIZING SCREW-PITCH ERROR COMPENSATION FUNCTION ..... 343
6.1 Function Explanation ..... 343
6.2 Specifications ..... 343
6.3 Parameter Setting. ..... 343
6.3.1 Screw-pitch compensation ..... 343
6.3.2 Screw-pitch error origin ..... 343
6.3.3 Offset interval ..... 344
6.3.4 Compensation value ..... 344
6.4 Cautions for Offset Setting ..... 344
6.5 Examples of Offset Parameters Setting ..... 344

## APPENDIX

Appendix 1. Dimensions of Additional Panel AP01 ..... 351
Appendix 2 Dimensions for Additional Panel AP02. ..... 351
Appendix 4 Alarm Information ..... 352
Appendix 5 Function Configuration of Standard Ladder Diagram ..... 357
5.1 Information for Ladder Diagram ..... 357
5.1.1 Introduction ..... 357
5.1.2 Information of Current Version ..... 357
5.2 ADDRESS DEFINITION ..... 358
5.3 FUNCTION CONFIGURATION ..... 361
5.3.1 Spindle CCW and CW Control ..... 361
5.3.2 Spindle JOG ..... 362
5.3.3 Switch Value Control for Spindle Speed ..... 363
5.3.4 Cycle Start and Feed Hold ..... 364
5.3.5 Cooling Control ..... 365
5.3.6 Lubricating control ..... 365
5.3.7 Optional Block Skip ..... 366
5.3.8 Machine Lock ..... 367
5.3.9 MST Lock ..... 367
5.3.10 Single Block ..... 367
5.3.11 Dry Run ..... 367
5.3.12 Optional Stop ..... 368
5.3.13 Stroke Limit and Emergency Stop ..... 368
5.3.14 Tri-color Indicator ..... 369
5.3.15 Reset and Cursor Return ..... 369
5.3.16 Rigid Tapping ..... 370
5.3.17 Spindle Exact Stop ..... 370
5.3.18 External MPG control ..... 371
5.4 Standard Ladder Diagram ..... 371

## VOLUME I PROGRAMMING

## CHAPTER 1 PROGRAMMING FUNDMENTALS

### 1.1 Introduction

GSK980MDa Milling Machine is a new generation of CNC system developed by GSK Company. As the upgraded version of GSK980MD, it supports milling, boring and drilling cycle. It employs 32 bits high-capability CPU and very large scale programmable device FPGA, applies real-time multi-task control technology and hardware interpolation technology, and is able to perform $\mu \mathrm{m}$ level precision motion control and PLC logic control. GSK980MDa is the optimum choice for upgrading CNC milling machine.

## Characteristics:

$\checkmark \quad$ Five axes control ( $\mathrm{X}, \mathrm{Y}, \mathrm{Z}, 4$ th and 5th); 3 axes linkage; optional interpolation precision $(1 \mu \mathrm{~m} / 0.1 \mu \mathrm{~m})$; maximum speed $60 \mathrm{~m} / \mathrm{min}$; optional axis types (linear axis or revolving axis) for the 4th and 5th axes; CS axis control available for the 4th and 5th axes.
$\checkmark \quad$ Electronic gear ratio: $(1 \sim 32767):(1 \sim 32767)$
$\checkmark$ Screw-pitch error compensation, backlash compensation, tool length compensation, tool abrasion compensation and tool nose radius compensation.
$\checkmark \quad$ Embedded with PLC can be downloaded to CNC from PC.
$\checkmark \quad$ DNC function supports for real-time program transmission for machining.
$\checkmark \quad$ Compatible with G commands in GSK980MC, GSK928MA and GSK980MD. 26 kinds of canned cycles, such as drilling/boring, circular/rectangular groove rough-milling, full circle/rectangular finish-milling, linear/rectangular/arc continuous drilling.
$\checkmark \quad$ Spindle encoder tapping and rigid tapping can be detected during tapping cycle, so that high precision machining can be performed.
$\checkmark$ Metric/inch programming; automatic chamfering function and tool life management function.
$\checkmark \quad$ Chinese, English, Russian and Spanish display selected by the parameters.
$\checkmark \quad$ Full screen program editing; 40MB program capacity for storing up to 40000 of part programs.
$\checkmark \quad$ USB data communication; CNC system upgrading, machining programs reading through $U$ disk and bidirectional transfer between CNC and U disk.
$\checkmark \quad$ Alarm log; multi-level passwords for equipment maintenance and management.
$\checkmark \quad$ Bidirectional transfer between CNC and CNC, CNC and PC; upgrade of CNC software and PLC programs;
$\checkmark$ The installation dimensions and the electric ports are compatible with GSK980MD, GSK980MC.

## Specifications

| Motion control | Controlled axes: five axes ( $\mathrm{X}, \mathrm{Y}, \mathrm{Z}, 4$ th and 5th); (for the 4th and 5th axes) optional axis types (linear axis or revolving axis) and CS contouring control available; |
| :---: | :---: |
|  | Interpolation functions: linear interpolation (for $\mathrm{X}, \mathrm{Y}, \mathrm{Z}, 4$ 4th and 5th axes); helical interpolation (for $\mathrm{X}, \mathrm{Y}$ and Z axes); circular interpolation (for arbitrary 2 axes). |
|  | Position command range: -99999999~99999999; least command increment: $1 \mu \mathrm{~m} / 0.1 \mu \mathrm{~m}$; (selected via parameters) |
|  | Electronic gear ratio: command multiplier 1~32767, command frequency divisor 1~32767 |
|  | Rapid traverse speed: maximum $60000 \mathrm{~mm} / \mathrm{min}$ Rapid traverse override: F0, $25 \%, 50 \%, 100 \%$ four levels real-time tuning |
|  | ```Cutting feedrate: maximum 15000mm/min (feed per min.) or 500mm/r. (feed per rotation) \\ Feedrate override: 0~150\% sixteen-level real-time tuning``` |
|  | Manual feedrate: $0 \sim 1260 \mathrm{~mm} / \mathrm{min}$ sixteen-level real-time tuning |
|  | MPG feed: $0.001,0.010,0.100,1.000 \mathrm{~mm}$ four gears. |
|  | Acceleration/deceleration type: S-type for rapid traverse; exponential-type for cutting feed. |
|  | Automatic chamfering |
| G Code | 65 kinds of G codes: G00, G01, G02, G03, G04, G10, G11, G17, G18, G19, G20, G21, G28, G29, G30, G31, G40, G41, G42, G43, G44, G49, G54, G55, G56, G57, G58, G59, G65, G66, G67, G73, G74, G80, G81, G82, G83, G84, G85, G86, G88, G89, G90, G91, G92, G94, G95, G98, G99, G110, G111, G112, G113, G114, G115, G134, G135, G136, G137, G138, G139, G140, G141, G142, G143 |
| Macro | 31 kinds of arithmetic, logical operations and skip can be achieved by macro command G65 |
|  | Macro statement command. eg:IF,WHILE,GOTO |
| Operation mode | Seven operation modes: EDIT, AUTO, MDI, DNC, MACHINE ZERO, MPG/STEP and MANUAL. |
| Tapping | Tapping function: lead $0.001 \sim 500 \mathrm{~mm}$ or $0.06 \sim 25400$ pitch/inch |

|  | Encoder tapping: settable line number of encoder ( 0 or100p/r $\sim 5000 \mathrm{p} / \mathrm{r}$ ) ; no detect for spindle encoder (when the line number is set to 0 ) |
| :---: | :---: |
|  | Rigid tapping: by rotary axis |
|  | Drive ratio between encoder and spindle: (1~255): (1~255) |
| Precision compensation | Backlash compensation: 0~2.000mm |
|  | Pitch error compensation: 255 compensation points per axis; compensation amount of each point: $\pm 0.255 \mathrm{~mm}$. |
|  | Tool compensation: 32 groups tool length compensation, tool wear compensation, cutter compensation C |
| M command | Special M commands (redefinition unallowed): M02,M29, M30, M98, M99,M9000~M9999. <br> Other M commands are defined or disposed by PLC program. |
|  | M commands defined by standard PLC program: M00, M03, M04, M05 M08, M09, M10, M11, M32, M33 |
| T command | tool number T01~T32 (32 numbers at most); manual tool change or auto-tool change selected by the parameters; auto tool change sequence set by PLC program. |
|  | Tool life management; 32 groups, 8 kinds/groups of tool life management data |
| Spindle speed control | Speed switching value control: $\mathrm{S} \square \mathrm{command}$ is defined or disposed by PLC program; the standard PLC programs S1, S2, S3 and S4 directly output; The output of $\mathrm{S} 1, \mathrm{~S} 2, \mathrm{~S} 3$, and S 4 are closed by S 0 . |
|  | Speed analog voltage control: the spindle speed per minute commanded by S codes; output $0 \sim 10 \mathrm{~V}$ voltage to spindle converter; spindle stepless speed changing supports 4 spindle mechanical gears |
| PLC function | 9 kinds of basic commands; 23 kinds of function commands; 2-level PLC program involving up to 5000 steps ( $2 \mu \mathrm{~s}$ processing time for each step). 8 ms refresh cycle for the first level program; Ladder diagram edit software and communication software downloadable |
|  | Integrated machine panel: 44 points input (key), 44 points output (LED) Basic I/O: 41 points input/ 36 points output |
| Display interface | Displayer: 480×234 lattice, 7" wide-screen multi-color LCD, |
|  | Display modes: Chinese, English, Russian, Spanish display selected by parameters; machining path displayable |
| Program edit | Capacity: 40MB for up to 40000 part programs; custom macro program call; 4 nesting-levels of subprogram |
|  | Edit modes: full-screen editing; absolute/incremental programming |
| USB | CNC system upgrade |
|  | Part programs reading in USB |
|  | Bidirectional files transfer between CNC and USB (including programs, parameters, PLC backup and recovery) |
| Clock display | Clock, date and week display. |
| Serial Communication | bidirectional transfer between CNC and PC, CNC and CNC (involving programs, parameters, tool compensation data); download and upgrade of system software and PLC program serial ports |

## Matching drive AC servo or step drive device by using the pulse+direction signal input. (DA98 unit or DY3 series)

## G Code Table

| Code | Function | Code | Function | Code | Function |
| :---: | :---: | :---: | :---: | :---: | :---: |
| G00 | Positioning (rapid traverse) | *G54 | Workpiece coordinate system 1 | G92 | Coordinate system setting |
| *G01 | Linear interpolation | G55 | Workpiece coordinate system 2 | *G94 | Feed per min. |
| G02 | Circular/helical interpolation (CW) | G56 | Workpiece coordinate system 3 | G95 | Feed per rotation |
| G03 | Circular/helical interpolation (CCW) | G57 | Workpiece coordinate system 4 | *G98 | Return to initial plane in canned cycle |
| G04 | Dwell, exact stop | G58 | Workpiece coordinate system 5 | G99 | Return to $R$ point in canned cycle |
| G10 | Tool life management | G59 | Workpiece coordinate system 6 | G110 | Inner circle groove roughing (CCW) |
| G11 | Tool life management end | G65 | Macro program/ macro code | G111 | Inner circle groove roughing (CW) |
| *G17 | XY plane selection | G66 | Macro program modal call | G112 | Inner circle finishing (CCW) |

## 1．2 Program $\square x e c u t i o n$

## 

The current program can only be run in automatic mode．GS $\square 980 \mathrm{MDa}$ cannot run more than 1 program at the same time，so only one program can be performed at a time．The cursor is ahead of the first block when a program is opened，and can be moved in DIT mode．In automatic mode，when the

## （1）

machine is in stop state，the cycle start signal（crars stand key on the panel or external cycle start signal） enables the program to be run from the block where the cursor is located．$\square$ sually，blocks are executed

moves along with program execution. The program execution se uence or state will be changed in following conditions $\square$

- Program running stops when
key or the $\square$ mergency Stop button is pressed $\square$
Program running stops when the C $\square \mathrm{C}$ alarm or PLC alarm occurs $\square$
- When the system is switched in $\square$ DIT or MDI mode, program stops running after the current ${ }^{\circ}$ 切 block is executed. $\square$ fter switching to automatic mode again, when crassimer key on the panel is pressed or external cycle start signal is $\mathrm{O} \square$, the program runs from the block where the cursor is located.
- If the operation mode is switched to M $\square \square \square \square \mathrm{L} / \mathrm{MPG} / \mathrm{ST} \square \mathrm{P} / \mathrm{M} \square \mathrm{CHI} \square \square \mathrm{Z} \square \mathrm{RO} \mathrm{R} \square \mathrm{T} \square \mathrm{R} \square$ mode when the program is running, the execution dwells $\sqsubset$ after switching to automatic mode
$\square$
again, when crals starn key on the panel is pressed or external cycle start signal is $\mathrm{O} \square$, the program runs from where it stops.
- The execution dwells when key is pressed or external pause signal is cut off $\square$ program starts running from where it stops when ${ }^{\circ}$ external cycle start signal is $\mathrm{O} \square \square$
- The program dwells at the end of each block when the single block switch is on $\square$ after估 pressing crasswankey or switching on external cycle signal, program continuously runs from the next block $\square$
- Blocks with mark $\square \square$ is skipped when the skip switch is $\mathrm{O} \square$.
- The obect block is executed when command G65 or macro program skip (GOTO) is specified.
- When M98 or M9000 M9999 command is performed, the corresponding subprogram or macro program is called $\square$ M99 is executed at the end of the subprogram or macro program, after returning to the main program, the subse $\sqsubset u$ ent block (the one after the block in which the subprogram is called) is executed. (return to a specified block, if it is commanded by M99) $\square$
- When M99 command is specified in the middle of a main program which is not called by other programs, the current program is repeatly executed after returning to the head of the program.

## 

When multiple words (such as G, X, Y, Z, F, R, M, S, T,) are in one block, most of M, S, and T words are interpreted by $\square \mathrm{C}$ and sent to PLC for processing. Other words are processed by $\square \mathrm{C}$ directly. M98, M99, M9000 M9999 and S word (which specify the spindle speed in r/min, m/min) are directly processed by $\square \mathrm{C}$ as well.

When G words share the same block with M00, M01, M02 and M30, M words are executed after G words, and $\square \mathrm{C}$ sends corresponding signals to PLC for processing.

When the G words share the same block with the M98, M99, M9000 M9999, these M words are performed by $\square C$ after $G$ words (the M signal not sent to PLC).

When G words and M，S，T words share the same block，PLC program（ladder diagram） determines the execution conse $\sqsubset$ uence（executed at the same time or G words before M，S，T words）． Refer to the manual from tool builder for relevant words execution se uence．

## 1．3 Basic $\square x e s$ Increment System

The increment system consists of the least input increment（for input）and least command increment（for output）．The least input increment is the minimum unit for programming moving distance．The least command increment is the minimum unit for moving the tool on the machine．Both increments are represented in mm ，inches．or deg．

The basic axes herein means $\mathrm{X}, \mathrm{Y}, \mathrm{Z}$ axes．The basic increment system includes IS－B and IS－C types which can be selected by bit ISC of parameter $\square \mathrm{O} .038$ ．

ISC $\square 1$ ：The increment system is IS－C（0．1■）；
$\square 0$ ：The increment system is IS－B（1■）
In different increment system，different pulse output type enables different output speed．
（Selected by bit $\square \mathrm{BPx}$ of parameter $\square \mathrm{O} .039$ ）

$\square \mathrm{BPx} \square 1$ ：The impulse mode of axis is $\square \mathrm{B}$ phases $\square$
0 ：The impulse mode of axis is impulse and direction．
$\square ⿴ 囗 ⿰ 丿 ㇄$

| $\square \mathbf{u t} \square \mathbf{u t} \square$ ode | $\square \square \mathrm{eed}$ |  |  |  |

## $\square ⿴ 囗 ⿰ 丿 ㇄$

In different increment system，the least input／output increment varies with metric／inch system． The specific data is shown as follows

| $\square \mathbf{u}$（ （1） |  |  | $\square$ ea $\quad$ t $\quad$ co $\square \square$ and ince $\square$ ent $\square 0 \square$ out $\square \square$ |
| :---: | :---: | :---: | :---: |
| Metric machine system | Metric input（G21） | 0.001 （mm） | 0.001 （mm） |
|  |  | 0.001 （deg） | 0.001 （deg） |
|  | Inch input（G20） | 0.0001 （inch） | 0.001 （mm） |
|  |  | 0.001 （deg） | 0.001 （deg） |
| Inch machine | Metric input（G21） | 0.001 （mm） | 0.0001 （inch） |
|  |  | 0.001 （deg） | 0.001 （deg） |

| system | Inch input (G20) | 0.0001 (inch) | 0.0001 (inch) |
| :--- | :--- | :--- | :--- |
|  |  | 0.001 (deg) | 0.001 (deg) |

| $\square \mathbf{u}(\mathrm{m} \mathbf{C}$ ) |  |  | $\square$ ea $\square \quad$ co $\square \square$ and <br> inc $\square$ ent $\quad \square$ <br> out $\square$ |
| :---: | :---: | :---: | :---: |
| Metric machine system | Metric input (G21) | 0.0001 (mm) | Metric machine system |
|  |  | 0.0001 (deg) |  |
|  | $\begin{aligned} & \text { Inch input } \\ & \text { (G20) } \end{aligned}$ | 0.00001 (inch) |  |
|  |  | 0.0001 (deg) |  |
| Inch machine system | Metric input (G21) | 0.0001 (mm) | Inch machine system |
|  |  | 0.0001 (deg) |  |
|  | $\begin{aligned} & \text { Inch input } \\ & \text { (G20) } \end{aligned}$ | 0.00001 (inch) |  |
|  |  | 0.0001 (deg) |  |

Least input increment (for input) is metric or inch can be set by G20 or G21.
Least command increment (for output) is metric or inch is determined by machine tool and set by bit SCW of parameter $\square 0.004$.

## $\square \square$ ata $\square$ an $\square \mathbf{0} \square$ nce $\square$ ent $\square \square \mathbf{t e} \square$

Limited by pulse output fre $\sqsubset u e n c y$, the data ranges may vary due to different increment system.

| nc $\mathrm{e} \square$ ent $\square \square$ te $\square$ |  | Co $\square \square$ and data in $\square$ ut an $\llbracket \square$ | $\square$ ata |
| :---: | :---: | :---: | :---: |
| 1 u (IS-B) | Metric input | -99999.999 $\square 99999.999$ (mm) | 5.3 |

|  | (G20) | -999.9999 $\square 999.9999$ (deg) | 3.4 |

$\square$ and $\square$ an $\square$ end $\square$ nit ol $\square$ nc $\square$ ent $\square \square$ te $\square$

- $\square \sqcap$ eed $\square \mathbf{a} \square$ ete $\square$

Machine tool types decide the units of linear axes speed, i.e. $\mathrm{mm} / \mathrm{min}$ for metric machine system is $0.1 \mathrm{inch} / \mathrm{min}$ for inch machine system.

The range of linear axis speed parameter is codetermined by machine tool type and increment system.

For example $\sqsubset$ data parameter $\square \mathrm{O} .070 \sqcap$ upper limit of cutting feedrate.

Chapter 1 Programming Fundmentals

| $\begin{array}{\|l} \hline \square \text { ac } \square \text { ine }^{2} \\ \text { tool t } \square e \end{array}$ | $\begin{aligned} & \hline \text { nc } \subset \text { ent } \\ & \text { te } \square \end{aligned}$ | $\square$ inea $\quad a \quad \square$ $\square$ eed unit | $\square \mathrm{a} \square$ ete $\square$ an $\square$ e | $\square$ ota $\square$ $\mathbf{a} \square$ <br> $\square \square$ eed unit  |
| :---: | :---: | :---: | :---: | :---: |
| Metric machine system | 1 u (IS-B) | $\mathrm{mm} / \mathrm{min}$ | $10 \square 60000$ | deg/min |
|  | 0.1 u (IS-C) |  | $10 \square 6000$ |  |
| Inch machine system | 1 u (IS-B) | $0.1 \mathrm{inch} / \mathrm{min}$ | 5 60000 |  |
|  | 0.1u (IS-C) |  | 5 6000 |  |

$\square$ s rotary axes are not involved in metric-inch interconversion, the rotation speed unit is always deg/min.
The switch between different increment systems may cause the excess of permitted running speed set by data parameter. Therefore, at the first power-on after switching, the system automatically modifies relevant speed parameters and gives an alarm.

## - nce $\square$ ent $\square \mathbf{a} \square$ ete $\square$

The unit and range of linear axis speed parameter are codetermined by machine tool type and increment system.

For example $\sqsubset$ parameter $\square \mathrm{O} 135 \triangle \mathrm{X}$ axis software limit.

| $\begin{array}{\|l} \hline \square \text { ac ine } \\ \text { tool t } \square e \end{array}$ | $\begin{aligned} & \hline \text { nc } \square \text { ent } \\ & \text { te } \square \end{aligned}$ | inc e ent unit | $\begin{aligned} & \text { inea } \square \square a \quad \text { ete } \\ & \text { an } \square \end{aligned}$ |
| :---: | :---: | :---: | :---: |
| Metric machine system | 1 u (IS-B) | 0.001 mm | -99,999.999■ 99,999.999 |
|  | 0.1u (IS-C) | 0.0001 mm | -9,999.9999■9,999.9999 |
| Inch machine system | 1 u (IS-B) | 0.0001inch | -9,999.9999■9,999.9999 |
|  | 0.1u (IS-C) | 0.00001 inch | -999.99999 999.99999 |

$\square$ s rotary axes are not involved in metric-inch interconversion, the rotary axis increment parameter unit is determined by increment system types. The ranges of rotary axis increment parameters are the same as that of metric machine tool.

| $\square$ ac $\square$ ine <br> tool t $\square \mathbf{e}$ | nce $\square$ ent <br> te $\square$ | $\square$ otation a $\square \square$ <br> $\square$ eed unit | $\square \mathbf{o t a t i o n ~} \quad$ a $\square$ <br> $\square \mathbf{e t e} \square$ an $\square$ |

### 2.1 M Codes (Miscellaneous Function)

The $M$ codes are composed by code address $M$ and $1 \curvearrowleft 2$ or 4 digits after the codes $M$ is used for controlling the program execution or outputting M code to PLC.

Codes value (00 99, 9000 9999, leading $\sqsubset$ ero can be omitted)
$\square d d r e s s$
M98, M99 and M9000 M9999 are independently processed by C■C, and the M codes are not output to PLC.

The function of M29 is fixed, namely, to output M codes to PLC.
The M02 and M03 are defined as program $\square \square \mathrm{D}$ codes by $\square \mathrm{C}$, meanwhile it also outputs M codes to PLC for the I/O control (spindle OFF, cooling OFF control etc.).

The PLC program can not change the meaning of the above-mentioned codes when the M98, M99 and M9000 M9999 are regarded as program C $\square$ LL codes and the M02 and M30 are regarded as program $\square \square$ codes. The codes of other M codes are all output to PLC program for specifying the code function please refer to the manual issued by machine tool manufacturer.

One block only has one M code. The $\mathrm{C} \square \mathrm{C}$ alarm occurs when two or more M codes are existed in one block.

Table 2-1 M code table for program execution

| Code $\square$ | Function |
| :---: | :---: |
| M02 | $\square$ nd-of-Run |
| M29 | Rigid tapping designation |
| M30 | $\square$ nd-of-Run |
| M98 | Subprogram call |
| M99 | Return from the subprogram the program will be repeatly executed If the code M99 is used for main program ending (namely, the curren program is not called by other programs). |
| M9000 ~ M9999 | Call macro program (Program $\square \mathrm{o}$. is larger than 9000) |

## $\square 1 \mathrm{ll} \|$ nd o $\square \square \mathbf{0} \square \mathbf{a}$

Format M02
Function The M02 code is executed in the $\square u t 0$ mode. The automatic run is ended after the other codes of current block are executed the cursor stops in the block in which the M02 is located and does not return to the head of the program. If the program is to be executed again, the cursor should return to the beginning of the program.
Besides the above-mentioned functions processed by C $\square \mathrm{C}$, the functions of code M02 also can be defined by the PLC ladder diagram. The function defined by standard ladder diagram can be the current input state of $\mathrm{C} \square \mathrm{C}$ is not change after the code M02 is executed.

## 

Format: M29
Function: In auto mode, after the execution of M29, the G74, G84 that followed is processed as在自
rigid tapping codes.

## 

Format M30
Function If M30 command is executed in the $\square$ uto mode, the automatic run is ended after the other commands of current block are executed $\square$ the system cancels the tool nose radius compensation and the cursor returns to the beginning of the program when the workpieces number is added by one (whether the cursor returns to the head of the program is determined by parameters).
The cursor does not return to the beginning of the program when the BIT4 of parameter $\square 0.005$ is set to $0 \square$ when it is set to 1 , the cursor returns to the beginning of the program as soon as the program execution is finished.
Besides the above-mentioned functions processed by $\mathrm{C} \square \mathrm{C}$, the functions of code M30 also can be defined by the PLC ladder diagram. The function defined by standard ladder diagram can be $\square$ turn OFF the M03, M04 or M08 output signal after the M30 command is executed, and meanwhile output M05 signal.
$\square \square \square \mathbf{u b} \square \mathbf{a} \square$ Call

Format: M98 Poooo뭄

Function $\square \mathrm{ln} \square$ uto mode, when the M98 is executed, the subprogram specified by P is called after the execution of other codes in the current block. The subprogram can be performed 9999 times at most. M98 cannot be performed in MDI, or an alarm will occur.

Format: M99 Poooo

The block No. (0000~9999) when return to main program is executed, the leading zero can be omitted.

Function $\sqsubset$ (in subprogram) as the other commands of current block are executed, the block specified by $P$ is performed continuously when the main program is returned. The next block is performed continuously by calling current subprogram of M98 command when returning to the main program because of the P is not given. If the main program is ended by using the M99 (namely, the current program is not called by other programs for execution), the current program will be run circularly. So, the M99 command is disabled in MDI.
$\square x a m p l e \square$ Fig. 2-1shows that the execution route of the subprogram is called (the P command within M99). Fig. 2-2 shows that the execution route of the subprogram is called (the P command is not in M99.

Fig. 2-1

This $\square \square 9 \square \square$ a can calls $\square$ uadruple subprogram, namel $\square$ the other subprogram can be called from the
subprogram. ( $\square$ ee $\square i g$. $\square \Pi$ )

### 2.4.1 Cutting feed ( $\square 94$ 95, F command)

 $\square \square \square \square \square \square$

## 

Note: In $\square 95$ mode, the cutting feedrate will be uneven when the spindle speed is less than 1 rev. min. The following error will $e$ ist in the actual feedrate when the spindle speed vibration occurs.

To guarantee the machine $\square u a l i t y$, it is recommended that the spindle speed selected in machining is not less than the lowest speed of available tor $\square \mathbf{u e}$ e ported by spindle servo or inverter.

| Z | Z axis coordinate value | -9999.999~9999.999 | Round-off |

### 3.2 Rapid PositioningG00

Format: G00 X $\qquad$ Y $\qquad$ Z__;
Function: $X, Y$ and $Z$ axes simultaneously move to end points from start at their rapid traverse rates. See Fig.

## 3-1.

Two axes move at their respective speeds, the short axis arrives at the end firstly, the long axis moves the rest of distance independently, and their resultant paths are possibly not linear.
Explanation: G00, which is initial G command;
The value ranges of $X, Y$ and $Z$ are indicated as -9999.999~+9999.999mm;
$X, Y$ and $Z$ axes, one of them can be omitted or all of them can be omitted. When one of them is omitted, it means that the coordinate value of start and end points are same. The start and end points share the same position when they are omitted at the same time.

## Command path figure:

Tool positions at the rapid traverse rate independently for each axis. Usually, the tool path is not linear.

Start point

Fig. 3-1
$\mathrm{X}, \mathrm{Y}$ and Z axes are separately set by the $\mathrm{s} \square$ stem data parameter $\square 0.059, \square 0.0 \square 0$ and $\square 0.0 \square 1$ at their rapid traverse rate, the actual traverse rate can be modified $\mathrm{b} \square$ the rapid override $\llbracket \llbracket s$ on the machine panel.

The rapid traverse acceleration or deceleration time constant of $X, Y$ and $Z$ axes are separatel $\square$ set $\mathrm{b} \square$ the $\mathrm{s} \llbracket$ stem data parameter $\square \mathrm{o} .0 \square 4, \square \mathrm{o} .0 \square 5$ and $\square \mathrm{o} .0 \square \square$
$\square$ xample $\square$ tool traverses from point A to point $\square$. See Fig.3-2.

(absolute coordinate programming)
(relative coordinate programming)

## 3.3 inear nterpolation G01

Format: G01 X YY Z F■;
Function: $\square$ ovement path is a straight line from start to end points.

Explanation: G01, which is modal G command;
The value range of $X, Y$ and $Z$ are indicated as -9999.999~+9999.999mm;
$\mathrm{X}, \mathrm{Y}$ and Z axes which one of them can be omitted or all of them can be omitted.

When one of them
is omitted, it means that the coordinate value of start and end points are consistent. The start and end points share the same position when they are omitted at the same time.
$F$ command value is vector resultant speed of instantaneous rates in $X, Y$ and $Z$ axes directions, the actual feedrate is the product of override and F command value;
F command value is invariable after it is performed till the new one is executed. The following G
command with F command word uses the same function.

The value range is indicated as follows $\square$

| Command function | G94 (mm/min) | G95 (mm/rev) |
| :---: | :---: | :---: |
| alue range | $1 \sim 15000$ | $0.001 \sim 500$ |

## Command path figure:

The linear interpolation is performed from point $\square$ to point $A \square \quad G 01 X \underline{\alpha} \quad Y \underline{\beta} \quad Z y F$
$\qquad$ ;

$$
L=\sqrt{\alpha^{2}+\beta^{2}+\gamma^{2}}
$$

The feedrate specified by F is the tool movement speed along the line. The speed of each axis is as follows:

Speed in $X$ axis direction: $F_{X}=\frac{\alpha}{L} \times f$
Speed in $Y$ axis direction: $F_{Y}=\frac{\beta}{L} \times f$
Speed in $Z$ axis direction: $F_{Z}=\frac{Y}{L} \times f$

Note: The F initial default value is set by data parameter No. 172 when the power is turned on.

## $\square \square \square \mathrm{rc}$ and $\square$ elical interpolation

Fo at:
$\square$ irc $\ddagger$ lar interpolation: $\square \mathrm{rc}$ in the $\square \square$ plane:

$\square \mathrm{rc}$ in the $\square \square$ plane:

$\square \mathrm{rc}$ in the $\square \square$ plane:

$\square$ elical interpolation
$\square \mathrm{rc}$ interpolation in $\square$ plane $\square$ axis linear interpolation lin $\lceil$ age $\square$

$\square \mathrm{rc}$ interpolation in $\square \square$ plane $\square \square$ axis linear interpolation lin age $\square$

$\square \mathrm{rc}$ interpolation in $\square \square$ plane $\square \square$ axis linear interpolation lin $\lceil$ age $\square$

Fun tion: $\square$ nly two axes of circ $\square$ lar interpolation can be lin $\sqsubset$ ed for controlling tool movement along with the arc on the selected plane in any time. ff the $\square^{r d}$ axis is specified sim Itaneo $\llbracket$ sly in linear interpolation mode $\square$ it will be lin $\subset e d$ by linear interpolation type to constit $\_$te helical interpolation. $\square \square \square$ movement path is $\square \square$ from start to end points. $\square \square \square$ movement path is $\square \square \square$ from start to end points.

## －planation：

$\square \square$ and $\square \square$ are modal $\square$ commands $\square$

$\square$ hen the circle center is specified by address $\square \square$ and $\square$ they are corresponding with the $\square \square$ and $\square$ axes separately．
$\square$ is the difference between the center point and the arc start point in the $\square$ axis direction $\square ⿴ 囗 ⿰ 丿 ㇄$

$\square$ is the difference between the center point and the arc start point in the $\square$ axis direction $\square$ center point coordinate $\square \square \square$ coordinate of circle arc start point $\square$ the val $\sqsubset$ e range are indicated as $\pi \square \square \square \square \sim \square \square \square \square \square \square$
$\square$ is the difference between the center point and circle start point in the $\square$ axis direction $\square$ $\square \square$ center point coordinate $\square \square \square$ coordinate of circle start point $\square$ the val $\sqsubset$ e range are

Note $\quad \square$ hen $\quad \square \square$ and $\square$ are for whole $\llbracket i r l e$ that they have si $\square$ ns a $\square$ ordin $\square$ to the
 and $\square \mathbf{a} \square$ otherwise they are ne ative ones．

| $\square$ | $\square$ istance from start point to circle center point |  | $\square$ | $\square$ axis distance from start point to the center point with sign |
|  |  |  | $\square$ | $\square$ axis distance from start point to the center point with sign |
|  |  |  | $\square$ | $\square$ axis distance from start point to the center point with sign |
|  |  | rc radi ${ }_{\text {L }}$ | $\square$ | $\square \mathrm{rc}$ radi $\ulcorner$ s |
| $\square$ | Feedrate |  | F | Feedrate along the arc |

$\square$ loc wise $\square$ and $\llbracket 0 \square$ ntercloc $\llbracket$ wise $\square$ are defined when $\square \square$ plane $\Pi \square$ plane $\square \square \square$ plane $\square$ is viewed in the positive to negative direction of the $\square$ axis $\square \square$ axis $\square \square$ axis $\square$ in the $\square$ artesian coordinate system $\square$ see the following fig $\sqsubset$ re：

The end point of an arc is specified by $\llbracket$ sing the address $\square \square \square$ or $\square \square$ and is expressed as an absol te or incremental val $\curvearrowleft$ e according to $\square \square \square$ or $\square \square \square$. The incremental val $\sqsubset$ e is the distance val $\sqsubset$ e from start to end points of an arc. The arc center is specified by address $\square \square$ and $\square$ against the $\square \square \square$ and $\square$ respectively. The n merical val $\sqsubset$ e following $\square \square$ and $\square \square$ however $\square$ is a vector component from start point of an arc to the center point $\square$ which is an incremental val $\sqsubset$ e with sign. $\square$ ee the following fig $\sqsubset \mathrm{re}$ :

The $F$ command is circ $\square a r$ interpolation rate in helical interpolation $\square$ in order to achieve the lin age interpolation between linear axis and arc the speed of linear interpolation by the $\quad r^{\text {rd }}$ axis has the following relationship to the $F$ command:

$$
f=F \times \frac{\text { Length of linear axis }}{\text { Length of circular arc }}
$$

elical interpolation path is as follows:
 interpolation axes is the specified one.
$\mathbb{T} \square$ and $\square$ have signs according to the direction. The circ $\square$ lar center also can be specified by radi $\square \square$ other than $\llbracket \square$ and $\square \llbracket$ as follows:

ㄴำ
$\square$ ow the following two arcs can be described $\square$ one arc is more than the ot is less than $\square$ The arc radi s which is less than is specified by the positive val the arc radi $\llbracket$ which is more than is specified by the negative val $\sqsubset$ e. The radi $\llbracket$ is either positive or negative when the arc command is e $\square$ al to
$\square$ xample $\square \mathrm{rc}(1)$ less than $\square \square \square$
ㄴำ
$\square \mathrm{rc}(2)$ more than $\square \square \square \square$
ㄴำ

xample for the programming

To program the above paths $\llbracket$ sing the absol $\downarrow$ te mode and incremental mode respectively:

Tllabsol te mode

ㄴำ

ㄴำ
ㄴำ

Tunncremental mode
१
१

ㅁำ

The feedrate of circ■ar interpolation is specified by F command it is the speed of the tool along the arc tangent direction.
Note 1: $\square \square$ and $\square \square$ an be omitted but it is very ne essary to input one of the addresses $\qquad$
$\square$ or $\square$ or the system alarm is $\square$ enerated.
Note 2: The $\square \square$ and $\square \square$ an be omitted simultaneously when the end and start points share same position. $\square$ hen the $\square$ enter point is spe $\llbracket$ ified by address $\square$ and $\square$ it is a $\square \square$ ar

The $\square i r l e$ is $\square \square$ when usin $\square \square$.
$\square 2 \square \square \quad$ not move $\square$
t is re $\square$ ommended that pro $\square$ rammin $\square$ uses $\square$. $n$ order to $\sqcap u a r a n t e e^{\text {the }}$ start and end points of the ar $\square$ are $\square$ onsistent with the spe ified value $\square$ the system will move by $\square$ ountin $\square \square$ ain a $\square$ ordin $\square$ to the sele ted plane $\square$ when pro $\square$ rammin $\square$ usin $\square$ the $\square \square$ and $\square$.

| $\square$ lane sele tion | $\square$ ount the radius $\square$ value a ain |
| :--- | :--- |
| $\square \square \square$ | $R=\sqrt{I^{2}+J^{2}}$ |
| $\square \square \square$ | $R=\sqrt{I^{2}+K^{2}}$ |
| $\square \square \square$ | $R=\sqrt{J^{2}+K^{2}}$ |

Note $\sqsubset$ : The error between the a tual tool feedrate and the spe ified feedrate is $2 \square$ or less. The $\sqsubset$ ommand speed is movement speed after tool radius offset alon $\square$ the ar $\square$.
Note $\ulcorner$ : The $\square$ is effe tive when address $\square \square$ and $\square$ are $\square$ ommanded with the $\square$ but the $\square \square$ and $\square$ are disabled at one time.
Note $\sqsubset$ : The $\mathbf{a}$ is not $\mathbf{e}$ ists is spe ified on the set plane the alarm o urs.
Note $\sqsubset$ : f the radius differen $\mathbb{e}$ between start and end points e $\square$ eeds the permitted value by parameter No. $1 \square$ alarm o urs.

## well

Format: $\quad \square \square \square \square$

Fun tion: $\square$ es stop the urrent $\square$ ommand mode and the data $\square$ status are invariable after delayin time spe $i f$ ified the ne $\square$ blo $\square$ will be e $\llbracket \subset$ uted.
$\square \square$ planation: $\square \square \square$ which is a non modal $\square$ Command $\square$
delay time is specified by command words
ee the following fig $\sqsubset$ re table for time $\llbracket$ nit of $\square \square$ and $\square \square$ command val $\llbracket$ e:

| $\square$ ddress | $\square$ | $\square$ |
| :---: | :---: | :---: |
| $\square$ nit | $\square \square \square \square \mathrm{s}$ | s |
| $\square$ vailable n | $\square \sim 9999999$ | $0 \sim 9999.999$ |

## Note:

- X can be specified by the decimal but $P$ not, or the alarm will be generated.
- When the $P$ and $X$ are not introduced or they are negative value, it means exact stop between the
- The $P$ is effective when the $P$ and $X$ are in the same block.
- The operation is held on when feeding during the G04 execution. Only the delay time execution is finished, can the dwell be done.

## 

| $\mathbf{G} \square$ | $\square \square \mathbf{X} \square \square \square \square \square$ |
| :--- | :--- |
| $\mathbf{G} \square$ | $\square \square \mathbb{X} \square \square \square \square$ |
| $\mathbf{G} \square$ | $\square \square \square \square \square \square \square \square$ |

$\square \square \square$

ommand example：

ㅁำ ；
Note：
Note $\square$ ：The plane selection command can share the same block with other group G commands．

Note $\square$ ：The move command is regardless of the plane selection．$\square$ or example，the axis is not $\mathrm{On} \mathbf{X} \square$ plane，the $\square$ axis movement is regardless of the $\mathbf{X} \square$ plane in command $\mathbf{G} \square$ $\square \square$.

```

Z, X or Y axis offsets a value at offset storage positively or negatively from the original end position according to the above command. Offset axes can be specified with G17, G18 and G19, offset direction can be specified with G43 and G44. Offset No. corresponding to the offset is specified by H code.

### 3.14 Workpiece Coordinate system G54~G59

## Format:

G54 X_ Y_ Z__; Workpiece coordinate system 1
G55 X_ Y_ Z__; Workpiece coordinate system 2
G56 X_ Y__ Z__; Workpiece coordinate system 3
G57 X_ Y_ Z__; Workpiece coordinate system 4
G58 X__ Y__ Z_; Workpiece coordinate system 5
G59 X__ Y_ Z__; Workpiece coordinate system 6

## Function:

There are 6 workpiece coordinate systems for machine tool regardless of the G92, any of coordinate system can be selected by G54~G59.

## Explanation:

$X$ : New $X$ axis absolute coordinate in current position;
Y: New $Y$ axis absolute coordinate in current position;
Z: New $Z$ axis absolute coordinate in current position.
These six workpiece coordinates are set by the distances (workpiece zero offset) from machine zero to each coordinate system origin.

## Exampl $\square:$

N10 G55 G90 G00 X100.0 Z20.0;
N20 G56 X80.5 Z25.5;
$\square$ apidly positioning to workpiece coordinate system 3 (X $\square 80.5$, $Z \quad 25.5$ ) from workpiece coordinate $\varsigma \llbracket$ stem $\square(X \square 100.0, Z \square 0.0)$. $\square$ or example, if N20 block is G91, it is incremental movement. The absolute coordinates automatically become the coordinates in coordinate system G56.

G55

The absolute position for the figure is coordinate value under the current coordinate system. ot $\square$ :

- Workpiece coordinate systems 1~6 is set up as soon as machine zero return is executed after power-on. When the system is restarted, the coordinate system is the one set by parameter No. 13 bit 17.
- Whether the relative position varies with coordinate system depends on status parameter №005 PP $\square$. when PP $\square \square 0$, it changes; when PP $\square \square 1$, it does not change.
- When the workpiece coordinate system function is determined, usually, G92 is not
needed to set coordinate system. if G92 is used, coordinate system 1~6 will be moved. $\square 0$ not confuse with $\square 9 \square$ and $\square 54 \sim \square 59$, unless workpiece coordinate systems G54~G59 are to be moved. When G54~G59 are in the same block with G92, G54~G59 are disabled.
- Workpiece coordinate system can be modified in the program run. The new coordinate system is effective till the system is restarted.

fit performs $\square 9 \square \mathrm{X} 100 \mathrm{Y} 100$ commands when the tool is positioned a ( $\mathrm{t} \square 00,160$ ) in the G54 coordinate system; the offset vector $\square$ for workpiece coordinate system 1 is ( $\mathrm{X}, \mathrm{Y}$ ). $\square$ nd the other workpiece coordinate systems offset for vector $\square$.

### 3.15 Compound Cycle Command

Generally, the canned cycle is a machining movement completion from one block with $G$ function to the completion of multi-block specified. Canned cycles make it easier for the programmer to create programs. With a canned cycle, a fre $\subset$ uently-used machining operation can be specified in a single block with a G function; without canned cycles, multiple blocks are needed, and canned cycles can shorten the program to save memory.

Generally, a canned cycle consists of a se $\sqsubset u e n c e$ of the following operations, see the right figure.
Operation 1... Positioning of axes X and $Y$
Operation 2...■apid traverse to point $\square$ plane
Operation 3...Hole machining;
Operation 4...Operation at the bottom of hole;
Operation 5... $\square$ etraction to point $\square$ plane Operation 6...■apid traverse to the initial Point

## ㅁㅔㅔा|

The data mode corresponded with G90 and G91 are different. The point $\square$ plane and the absolute position machined at the bottom of the hole are specified by $\square$ and $Z$ values, when the
command is G90. The specified $\square$ value is the distance relative to the initial plane, and the $Z$ value is the distance relative to the $\square$ point plane when the command is G91. $\square$ ee the $\square$ ig. 13.1 ( $\square$ )

$\square$ ig. 13.1 ( $\square$ ) $\square$ bsolute and incremental commands for canned cycle

## $\square$ पा

Tool can be returned to the initial plane or point $\square$ plane according to G98 and G99 during returning. $\sqsubset$ ee the following figure $\square$ ig. 13.1 (C).

Normally, the initial hole machining is used by G99, the last machining is used with G98. The initial level will not be changed when the hole machining is done by G99.

$\square$ ig.13.1 (C) $\sqsubset$ evels for initial and point $\square$
 in icat $\square$ rom $t \square$ cann $\square \mathbf{c} \square$ clanc llation to $\square$ tart $\square$
$\square$ ロ|mimann $\square \mathbf{c l} \square$ canc llation
There are two ways for canned cycle cancel are listed below:

1. Canceling the canned cycle with the G80
2. The canned cycle is cancelled by the G00, G01, G02 and G03 command in group 01.
(1) When the canned cycle is cancelled by the command G80, if the G00, G01, G02 and G03 of the 01 group are not specified, then the reserved modal command (G00 or G01) performs motion before using canned cycle.

■or example:
N0010 G01 X0 Y0 Z0 $\sqsubset 800$; (The modal command is G01 before entering the canned cycle)

N0020 G81 X10 Y10 R5 Z-50; (Entering canned cycle)
N0030 G80 X100 Y100 Z100; (The modal G01 command reserved before canned cycle performs cutting feed )
If the G01 is not specified in the abovementioned program N0010, but G00, the G00 performs rapid positioning for N0030.

When both command G80 and commands G00, G01, G02 and G03 are specified in block, actions are performed by the latter, G00, G01, G02 and G03.

For example:
N0010 G01 X0 Y0 Z0 F800; (The modal command is G01 before entering the canned cycle)

N0020 G81 X10 Y10 R5 Z-50; (Entering canned cycle)
N0030 G00 G80 X100 Y100 Z100; (The G00 performs positioning at the rapid rate, and the modal command G00 is saved)
Note: The cutting feedrate by F command is still held on even if the canned cycle is cancelled.

### 3.15.1.6 General command format for canned cycle

Once the hole machining data is specified in the canned cycle, it is held until the canned cycle is cancelled. So the hole machining data should be outright specified at the beginning of the canned cycle, only the modified data is specified in the following canned cycle.

The general command format of canned cycle: $G_{-} X_{-} Y_{-} \mathbf{R}_{-} Z_{-} \mathbf{Q}_{-} \mathbf{P}_{-} \square_{-} \quad$ L;
All commands for canned cycle are listed in above-mentioned format. But it is not needed to specify the above-mentioned format in each canned cycle. For example, the canned cycle can be performed as long as the $G$ command (hole machining) and any of $X, Y, Z$ and $R$ are specified; additionally, Q or P is not available in some canned cycle G command (hole machining), the command is disabled even if these data are specified, they are regarded as modal data memories only.

Table 13.1. $\square$ ommand e $\square$ lanations for canned cycle

| $\square$ ecifying content | $\square$ ddress | Dlanation for command address |
| :---: | :---: | :---: |
| $\square$ ole machining | G | Refer to the canned cycle list. |
| ole position data | X, Y | Specifying the hole position with the absolute and incremental value, control is same with GOO position. $\square$ nit: mm; |
| $\square$ ole <br> machining data | R | See the fig.13.1 (B), the distance from initial point level to point $R$ plane is specified by using the incremental value, or specifying the coordinate value of the point $\square$ by absolute value. $\square$ nit: mm ; |
|  | Z | ole depth. See the fig. 13.1 (A), the distance from R point to the bottom of a hole is specified by using the incremental value or specif-ing the coordinate value of the hole bottom by absolute value. $\square$ nit: mm ; |
|  | Q | Specifying each cut-in in G $\square 3$ and G 83 or translational value in $\mathrm{G} \square \square$ and G87. $\square$ nit: mm; |
|  | P | Specifying the dwell at the bottom of a hole. Relation of time and the numerical specified are same with G0■. $\square$ nit: ms; |
|  | $\square$ | $\square$ achining cycle for $\square$ holes is performed from start (start position of block) to XY coordinate position. |
|  | F | The cutting feedrate is specified, tooth pitch is indicated in G■■ and G8■. |

A part of command of canned cycle such as G110, G111, G112, G113, G11■, G115, G13■, G135, G13 $\square$ G13 $\square$ G138 and G13 are explained in the following chapters or sections.

### 3.15. escri tion for canned cycle

### 3.15. $\square$ igh $s$ eed $\llbracket$ ec drilling cycle $\mathbf{G} \cdot 3$

## Format: G G G $\mathbf{G}$ X_ Y_ R_Z_ Q_ F_ L_;

Function: This kind of cycle performs high-speed peck drilling, it performs intermittent cutting feed to the bottom of a hole, and eliminating the chips from the hole simultaneously.
$\square \square$ lanation: Refer to the command explanation of canned cycle in Table 13.1.■.
$\square$ ycle $\square$ rocess:
(1) Positioning to $X Y$ plane level at the rapid traverse;
(2) $\square$ own to the point R plane at the rapid traverse rate;
(3) $\square$ utting feed for Q distance;
( $\square$ ) Retract $d$ distance in rapid traverse;
(5) $\square$ utting feed for (Q $\square$ ) distance
( $\square$ ) achine to the $Z$ axis hole bottom by cycling the ( $\square$ ) and (5);
( $\square$ ) Return to the start point level or point R plane according to $\mathrm{G} \square 8$ or $\mathrm{G} \square$ at the rapid traverse.

## ommand Path:

## Related $\square \square$ lanation:

(1) This kind of cycle is peck drilling for $Q$ value intermittent feeding along the $Z$-axis direction. The $Q$ value should be positive, the sign is ineffective even if the negative value is specified. If the $Q$ value is not specified, then it defaults 0.1 mm . If a depth to be cut is less than the $Q$ value, then cut to the bottom of the hole without tool retraction at the rapid traverse for the first time.
(2) To remove chips from the hole easily, a small value can be set for retraction. This allows drilling to be performed efficiently. The tool is retracted in rapid feed, the retraction amount d is set by parameter No.51, the default is 1000 , unit: 0.001 mm .
(3) The command $P$ is disabled, but its value is reserved as canned cycle modal value.

### 3.15. $\square$ Left handed ta ing cycle $G \square$

Format: $\mathbf{G} \mathbf{G} \mathbf{G} \square \mathbf{X}_{-} \mathbf{Y}_{-} \quad \mathbf{R}_{-} \quad \mathbf{Z}_{-} \quad \mathbf{P}_{-} \quad \mathbf{F}_{-} \quad \mathbf{L}$
Function: This cycle performs left-handed tapping. In the left-handed tapping cycle, the spindle rotates clockwise for tapping till the bottom of the hole has been reached, then retracts by counter-clockwise after dwell.
lanation: For canned cycle explanation, see the Table 13.1. $\square$
Thereinto, the $F$ is indicated for tooth pitch. The value range are indicated as $0.001 \square 500.00 \mathrm{~mm}$ (metric), $0.0 \square 25 \square 00$ teeth Iinch (inch)
$\square$ ycle $\square$ rocess:
(1) Positioning to XY plane level at the rapid traverse;
(2) $\square$ own to the point R plane at the rapid traverse;
(3) Tapping to the bottom of a hole;
(■) The spindle stops;
(5) Pause for time P if dwell is specified;
( $\square$ ) The spindle rotates $\square \square \mathrm{W}$, and then retracts to point R plane;
$(\square)$ The spindle is stopped; pause for time $P$ if dwell is specified;
(8) Spindle rotates $\square \mathrm{W}$;
( $\square$ ) Return to the initial plane if it is $G \square 8$.

## $\square$ ommand Path:

## Related lanation:

(1) Tapping to the bottom of a hole it will not be returned immediately even if the $P$ is omitted or regarded as 0 in this cycle, it will be returned after a dwell time (2s), and this time is set by system.
(2) The $F$ is tapping modal value, the last tapping $F$ value is taken when it is omitted, or alarm will be generated if it does not exist.
(3) The metric or inch of the F value is determined by G20 (metric) or G21 (inch).
$(\square)$ The command $Q$ is disabled in this cycle, but its value will be reserved as canned cycle modal value.
3.15. $\quad$ Ta $\square$ ing cycle $\mathbf{G}$

Format: $\mathbf{G} \mathbf{G} \quad \mathbf{G} \mathbf{X}_{-} \mathbf{Y}_{-} \mathbf{R}_{-} \mathbf{Z}_{-} \mathbf{P}_{-} \mathbf{F}_{-} \mathbf{L}_{-}$;
Function: This cycle is used to machine a thread. The tapping is performed by spindle rotating positively, when the bottom of a hole has been reached, the spindle is retracted in the reverse direction.
lanation: For command explanation of canned cycle, see the Table 13.1.
Thereinto, the $F$ is tooth-pitch. The value range is $0.001 \square 500.00 \mathrm{~mm}$ (metric), $0.0 \square 25 \square 00$ tooth Iinch (inch).

## $\square$ ycle Process:

(1) Positioning to the XY plane level at the rapid traverse;
(2) $\square$ own to the point R plane at the rapid traverse;
(3) Tapping to the bottom of a hole;
( $\square$ ) Spindle stops;
(5) For dwell time P if it is commanded
( $\square$ ) Spindle returns to the point R plane in reverse direction;
( $\square$ ) Spindle stops; for dwell time P if the P is commanded;
(8) The spindle is rotated in the positive direction;
( $\square$ ) Returning to the initial point level if it is $G \sqsubset 8$.

## ommand Path:

Related lanation:
Please refer to the related explanation for $G \square \square$ ( $\square$ ounter tapping cycle)

### 3.15. $\square \square$ rilling cycle $\llbracket$ ot drilling cycle $\mathbf{G} \square 1$

Format: $\mathbf{G} \square \mathbf{G} \square \mathbf{G} \mathbf{X} \square \mathbf{Y}_{-}$R_ Z_ F_ L_;
Function: This cycle is used for normal drilling. $\square u t t i n g$ feed is performed to the bottom of the hole, the tool is then retracted from the bottom of the hole in rapid traverse.
lanation: For the command explanation of canned cycle, see the Table 13.1.■
$\square$ ycle Process:
(1) Positioning to the XY plane level position at the rapid traverse;
(2) $\square$ own to the point R plane at the rapid traverse;
(3) $\square$ utting feed to the bottom of the hole;
( $\square$ ) Returning to the initial point or point R plane at rapid traverse according to the G 8 or $\mathrm{G} \square$; ommand Path:

| G■8 Return to the initial plane at the <br> rapid traverse | $\mathrm{G} \square$ Return to the R point plane at the <br> rapid traverse |
| :--- | :--- | :--- |

## Related lanation:

The command Q or P is disabled in this cycle, but its value will be saved as canned cycle modal value.
3.15. $\square$ rilling cycle $\sqsubset$ counter boring cycle $\mathbf{G} \square$

## Format: $\mathbf{G} \square \mathbf{G} \square \mathbf{G} \square \mathbf{X} \mathbf{Y}_{-} \mathbf{R}_{-} \mathbf{Z}_{-} \mathbf{P}_{-} \mathbf{F}_{-} \mathbf{L}_{-}$;

Function: $\square$ utting feed is performed to the bottom of the hole. $\square$ ole depth precision is added when the dwell is performed, and then the tool is retracted from the bottom of the hole at rapid traverse.
Ianation: For the command explanation of these canned cycles, see the Table 13.1. $\square$ $\square$ ycle $\square$ rocess:
(1) Positioning to the XY plane level at the rapid traverse;
(2) $\square$ own to the point R plane at the rapid traverse;
(3) $\square$ utting feed to the bottom of a hole
( $\square$ well for P time if it is commanded.
(5) Returning to the initial point or point R plane according to $G \subset 8$ or $G \square$ at the rapid traverse; ommand Path:

| G■8 Return to the initial point level at the rapid traverse | G $\square$ Return to the point $R$ plane at the rapid traverse |
| :---: | :---: |
|  |  |

## Related $\square \square$ lanation:

(1) They are basically the same as G81 (drilling and spot-drilling machining), it is up after dwell at the bottom of a hole only (the dwell time is specified by P, the dwell will not be executed if it is not specified, and the command action is same as that of G81). In the blind hole, the accuracy of hole can be improved by the dwell.
(2) The command $Q$ is disabled in this cycle, but its value will be reserved as the canned cycle modal value.

### 3.15. 6 Pec $\square$ drilling cycle G 3

Format: G G G $\mathbf{G} \mathbf{X}_{-} \mathbf{Y}_{-} \mathbf{R}_{-} \mathbf{Z}_{-} \mathbf{Q}_{-} \mathbf{F}_{-} \mathbf{L}_{-}$;
Function: This cycle performs high-speed peck drilling; it performs intermittent cutting feed to the bottom of a hole while removing chips from the hole.
$\square \square$ lanation: The command explanation for canned cycle, see the table 13.1.■
$\square$ ycle Process:
(1) Positioning to the XY plane level at the rapid traverse;
(2) $\square$ own to the point R plane at the rapid traverse;
(3) $\square$ utting feed for Q distance;
( $\square$ ) Retract to the point $R$ plane at the rapid traverse;
(5) Rapid feed to d distance to the end surface
( $\square$ ) utting feed for (Q $\square \mathrm{d}$ ) distance;
( $\square$ ) $\square$ ycling ( $\square$ ) (5) and ( $\square$ ) to the bottom of a hole along Z-axis;
(8) Return to the initial point or point R plane according to the G 8 or $\mathrm{G} \square$ at the rapid traverse;
ommand Path:

Related $\square \square$ lanation:
(1) Same as $G \sqsubset 3$, after feeding for $Q$, it returns to the point $R$ plane at the rapid traverse firstly, and then rapid feeds to dmm to the end surface, then cutting feed is applied and the cycle is performed in turn. The $Q$ value should be positive, even if the negative value is specified, and the sign is also disabled. $Q$ value 0.001 mm is defaulted if $Q$ value is not specified; $d$, is set by the parameter No.52, its default value is 1000 , and the unit is 0.001 mm . If the cutting depth is less than the $Q$ value, then cutting to the bottom of a hole at the first time, and rapid traverse retraction is not performed.
(2) The command $P$ is disabled in this cycle, but its value will be reserved as canned cycle modal value.

### 3.15. $\square$ oring cycle $\mathbf{G} 5$

Format: $\mathbf{G} G \square \mathbf{G} \mathbf{X}_{-} \mathrm{Y}_{-} \mathrm{R}_{-} \mathbf{Z}_{-} \mathrm{F}_{-} \mathrm{L}_{-}$;
Function: After positioning along $X$ and $Y$ axes, rapid traverse is performed to point $R$; the boring is performed from point $R$ to point $Z$ thereafter. $\square u t t i n g$ feed is performed to return point $R$ plane when the $Z$ point has been reached the bottom of a hole.
$\square$ lanation: $\square$ ommand explanation for the canned cycle, see the table 13.1.■.
ycle $\square$ rocess:
(1) Positioning to the XY plane level at the rapid traverse;
(2) $\square$ own to the point $R$ plane at the rapid traverse;
(3) $\square$ utting feed to the bottom of a hole;
( $\square$ ) utting feed to the point R plane;
(5) Returning to the initial point level if it is $G \square 8$;
ommand Path:

## Related $\square \square$ lanation:

(1) This cycle is used to bore a hole. The command motion is basically same as the G81 ( $\square$ rilling, Spot-drilling cycle), the difference is that by the $G 81$ it returns to the point $R$ plane in rapid traverse rate, while by the G85 it returns to the point $R$ plane in feedrate when the cutting feed reaches the bottom of a hole.
(2) The $Q$ and $P$ commands are disabled in this cycle, but its value is reserved as the canned cycle modal value.
3.15. $\square \square$ oring cycle G 6

Format: $\quad \mathbf{G} \square \mathbf{G} \square \quad \mathbf{G} \square \mathbf{X}_{-} \mathbf{Y}_{-} \mathbf{R}_{-} \mathbf{Z}_{-} \mathbf{F}_{-} \mathbf{L}_{-}$;
Function: After positioning along $X$ and $Y$ axes, rapid traverse is performed to $R$ point, and the boring is performed from point $R$ to point $Z$. The tool is retracted in rapid traverse and spindle is rotated positively when the spindle is stopped at the bottom of the hole.
lanation: For command explanation for canned cycle, see the table 13.1.■.
ycle $\square$ rocess:
(1) Positioning to the $X Y$ plane level at the rapid traverse;
(2) $\square$ own to the point $R$ plane at the rapid traverse;
(3) $\square$ utting feed to the bottom of a hole;
( $\square$ ) The spindle stops;
(5) Returning to the initial point or point $R$ plane at rapid traverse according to the $G \square 8$ or $G \square \square$;
$(\square)$ The spindle is rotated in the positive direction;
ommand Path:

Related lanation:
(1) This cycle is used to be bore a hole. The command operation is basically same with G81, only spindle rotation status is different. After cut feeds to the bottom of a hole, the $\square 05$ is executed (spindle stops), then the point $R$ plane is retracted at the rapid traverse, the $\square 03$ is then performed (spindle rotates positively) regardless of the currently spindle rotation status and the positive or negative rotation are specified before the canned cycle.
(2) The command $Q$ and $P$ are disabled in this cycle, but its value is reserved as canned cycle modal value.
3.15. $\square$ oring cycle $\mathbf{G} \square$

Format: $\mathbf{G} \square \mathbf{G} \square \mathbf{G} \square \mathbf{X}_{-} \mathbf{Y}_{-} \mathbf{R}_{-} \mathbf{Z}_{-} \mathbf{P}_{-} \mathrm{F}_{-} \mathbf{L}_{-}$;
Function: A dwell is performed at the bottom of a hole, the spindle is stopping. If the manual operation is applied now, tool can be removed manually. It is better to retract the tool safely from the hole regardless of any kind of manual operation. It is rapidly retracted to point $R$ or initial plane when the automatic operation is performed again, the spindle is stopped and G88 is finished.
lanation: For the command explanation of the canned cycle, see the table 13.1.■.
ycle $\square$ rocess:
(1) Positioning to the XY plane at the rapid traverse rate;
(2) $\square$ own to the point R plane at the rapid traverse rate;
(3) $\square$ utting feed to the bottom of hole;
( $\square$ ) The spindle is stopped;
(5) $P$ time is delayed if it is specified.
( $\square$ anual operation will be performed if the dwell is executed.
( $\square$ ) Restoring the automatic mode, retracting to initial point or point R plane according to the $\mathrm{G} \square 8$ or $\mathrm{G} \square$ at the rapid traverse rate.
(8) The spindle rotates positively;
ommand Path:

## Related lanation:

The command $Q$ is disabled in this cycle, but its value is reserved as the canned cycle modal value.

### 3.15. $1 \square$ oring cycle G

Format: G G G $\square \mathbf{X} \quad \mathbf{Y}_{-} \quad \mathbf{R}_{-} \mathbf{Z}_{-} \mathbf{P}_{-} \mathrm{F}_{-} \mathbf{L}_{-}$;
Function: This cycle is used to bore a hole normally. This cycle performs a dwell at the bottom of the hole; the tool is then retracted from the bottom of the hole at the rapid traverse rate.
(lanation: For the command explanation of the canned cycle, see the table 13.1...
ycle $\square$ rocess:
(1) Positioning to XY plane at the rapid traverse rate;
(2) $\square$ own to the point R plane at the rapid traverse rate;
(3) $\square$ utting feed to the bottom of a hole;
( $\square$ ) For dwell time $P$ if the $P$ is specified;
(5) $\square$ utting feed to the point $R$ plane;
( $\square$ ) Returning to the initial point level if it is $G \sqsubset 8$;
( $\square$ ) Returning to the initial point or point $R$ plane at the rapid traverse according to the $G \subset 8$ or G■;

## ommand Path:

## Related $\square \square$ lanation:

(1) G8 $\square$ (Boring cycle) is basically same as the G85, a dwell is applied at the bottom of a hole ( $\square$ well time is specified by P, if it is not specified, the dwell is not applied, the command operation is same to the G85)
(2) The command $Q$ is disabled in this cycle, but its value is reserved as canned cycle modal value.

### 3.15. $\square 11$ Groove rough milling inside the round G11 G111

## Format:

G11
$\mathbf{G} \mathbf{G} \square$
G111 $\quad \mathbf{X}_{-} \mathbf{Y}_{-} \mathbf{R}_{-} \mathbf{Z}_{-} \quad \square \square_{-} \mathbf{Q}_{-} \square_{-} \square_{-} \square_{-} \mathbf{F}_{-}$
Function: From the beginning of the center point, arc interpolations are performed helically till the round groove of programming dimension has been machined.

Ianation: For command explanation of the canned cycle, see the table 13.1. .
G110: Groove rough-milling inside the round in $\square \square \mathrm{W}$;
G111: Groove rough-milling inside the round in $\square \mathrm{W}$;
$\mathrm{I}: ~ I$ is radius inside the round groove, it should be more than the radius of current tool.
$W$ : The firstly cutting depth is from the R reference level to the undersurface along the $Z$ axis direction, it should be more than 0 (The first cutting position is over the bottom of the groove, then bottom position is regarded as machining position);
Q: The cutting incremental value each time along $Z$ axis direction;
$\square$ : The width increment of cut inside XY plane, it should be less than the tool radius, and more than 0 ;
$\square$ : The distance to the end machining plane at the rapid traverse, it should be more than 0 when cutting;
$\square$ : Tool radius serial number, the value range is $0 \square 32,0$ is the default of $\square 0$. The current
tool radius is determined by the specified serial number.
ycle $\square$ rocess:
(1) Positioning to the XY plane level at the rapid traverse rate;
(2) $\square$ own to the point R plane at the rapid traverse rate;
(3) $\square$ ut W depth downwards in cutting feedrate
( $\square$ ) ill a round face with radius I helically by $\square$ increment each time from center point to outside.
(5) The $Z$ axis is retracted to the $R$ reference surface at the rapid traverse rate;
( $\square \mathrm{X}$ and Y axes are positioned to the center at the rapid traverse rate;
( $\square$ ) $\square$ own to distance $\square$ to the end machining surface along Z axis at the rapid traverse rate;
(8) $\square$ ut along $Z$ axis for ( $\mathrm{Q} \square$ ) depth;
( $\square$ ) ycling the operations from ( $\square \square(8)$ till the round surface of total depth is finished.
(10) Return to the initial plane or point $R$ plane according to $G \subset 8$ or $G \square \square$.

## ommand Path:

## Related $\square$ lanation:

The $P$ and $\square$ are disabled in this cycle, but the $P$ value will be reserved as canned cycle modal value.
For $\mathbf{e}$ am le: A round inside groove rough-milling is specified in canned cycle G111, see the following

G1 $\square 1 \square$ Punching in $\square \square W$

$\mathrm{X}, \mathrm{Y} \square$ End coordinate of the first rectangle side
$\mathrm{R} \square \mathrm{R}$ plane position
Z $\square \square$ ole depth
A $\square$ The punching number on the $1^{\text {st }}$ and $3^{\text {rd }}$ side
B $\square$ The punching number on the $2^{\text {nd }}$ and $\square^{\text {th }}$ side

- The length of the $2^{\text {nd }}$ side

F $\square \square$ utting feedrate

## Related Parameter:

Bit $\square$ of the parameter $01 \square$
1: $\square$ ole positioning of serial punching is performed by cutting path (G01■G03).
0 : $\square$ ole positioning of serial punching is performed by the rapid traverse path (G00).
For example:
The end point coordinate of the rectangle first side is $\mathrm{X} \square 0, \mathrm{Y} \sqsubset 0$; the length of the $2^{\text {nd }}$ side is 20 mm as for the rectangle path punching. The punching holes are machined by G81, to punch 3 holes at $1^{\text {st }}$ and $3^{\text {rd }}$ side each other; punch 2 holes at $2^{\text {nd }}$ and $\square^{\text {th }}$ side each other, the hole depth is 25 mm ;
ts $\square$ rogramming is as follo $\square$ s:
$\mathbf{G} \square \mathbf{G 1} \square \mathbf{G} \square \mathbf{X} \square \mathbf{Y} \square \mathbf{Z}$;
$\square$ 3;

$\mathbf{G} \square \mathbf{G} \square \mathbf{Y} 1 \square \mathbf{5}$;
$\square 3 \square$

There are 10 holes such as $\mathrm{A} 1 \square \mathrm{~A} 3, \mathrm{~B} \square, \mathrm{~B} 5, \mathrm{~A} \square \mathrm{~A} 8, \mathrm{~B} \square$ and B 10 to be machined as in above figure.

Note 1: f the G1 $\square$ or G1 $\square 1$ is secified in the canned cycle $\square$ it indicated that the rectangle serial $\square$ unching $\square$ ill be $\sqsubset$ erformed. The rectangle data are defined according to $\mathbf{s} \square$ ecified $\mathbf{X} \square$ Y coordinates and $\square$ value in a $\square$ rogram $\square$ and the serial $\square$ unching cycle is $\square$ erformed
according to the unch mode canned cycle command.
Note $\square$ : The command value of ma imum $\square$ unching number $\square$ and $\square$ at each side is $\square \square \square$; the command is disabled $\square$ hen it is negative. The decimal $\square$ art $\square$ ill be rounded off if the command is decimal; if the $\square$ or $\square$ is not $\mathbf{s} \square$ ecified then $\square$ is a default.
Note 3: The rectangle is defined by the current start $\square$ oint $\square$ the end of the 1st side and the length of the $\square$ nd side; the default is current start $\square$ oint if the end of 1st side is not s $\square$ ecified; the alarm $\square$ ill be generated if the length namely the $\square$ is not $\mathbf{s} \llbracket$ ecified $\square$ of nd side is not $\mathbf{s}$ ecified.
Note $\sqsubset$ : The returned levels are all $\mathbf{R} \square$ oint $\square$ lane in serial $\square$ unching $\square$ the corres $\square$ onding $\square$ lane $\square$ ill be retracted according to $\mathbf{G} \square \mathbf{G} \square \mathbf{s} \square$ ecified in a bloc $\square \square$ hen the last hole is erformed.
Note 5: $\square$ anned cycles $\llbracket$ such as G11 $\square \mathbf{G 1 1 1} \square \mathbf{G 1 1} \square \mathbf{G 1 1 3} \square \mathbf{G 1 1} \square \mathbf{G 1 1 5} \square \mathbf{G 1 3} \square \mathbf{G 1 3 6} \square \mathbf{G 1 3} \square \mathbf{G 1 3} \square$ and G13 have no serial unching functions.
Note 6: The command $\square$ ords G1 $\square G 1 \square 1 \square \square \square$ and $\square$ are only effective in current bloc $\square$. The alarm $\square$ ill be generated if the G1 $\square$ and G1 $\square 1$ are s ecified $\square$ ithout the canned cycle $\square$ unching $\square$ The $\square \square \square$ and $\square \square$ ill be ignored if $\square \square$ and $\square$ are s $\llbracket$ ecified instead of the $\mathbf{G 1} \square \square$ or G1-1.

### 3.15.3.3 $\square$ rc serial $\square$ unching $\mathbf{G 1} \square \mathbf{G 1} \square \square$

Format:

$\square \square$ Radius of arc $\square$ hen a negative value is $\mathbf{s} \sqsubset$ ecified it is maor arc.
$\square \square \square \square$ The circle center and radius are calculated by $\square \square \square$ hen the $R$ value is not $\mathbf{s}$ ecified.
$\square \square$ Number of $\square$ unching
F $\square$ utting feedrate

## Related Parameter:

Bit $\square$ of the parameter 01 $\square$
1: $\square$ ole positioning for serial punching is performed by cutting path (G01■G03).
0 : $\square$ ole positioning for serial punching is performed by the rapid traverse path (G00).
For example:
G $\square 1$ G12 G81 X100 R50 Z-50

Example 2: when drilling $\square$ holes in full circle, the start points and end points are coordinate origins, and the radius is 50 , hole depth is 50 .

O0001;
G00 G 0 X0 Y0 Z0 G1■;
G 8 G1■2 G82 I50 0 R-10 Z-50 $\square \square F 3000$;
$\square 30$;

Note 1: $n$ continuous drilling $\square$ hen the start $\llbracket$ oint is identical to end $\llbracket$ oint $\llbracket$ no drilling $\square$ ill be $\quad$ erformed.

Note $\llbracket$ anned cycle G11 G111 G11 G113 G11 G115 G13 G135 G136 G13 G13 G13 has no continuous drilling function.
Note 3: The ma imum drilling number $\square$ is $\square \square \square$; the negative value is $\square$ rocessed as absolute value; the decimals are rounded.
Note $\square: \square$ hen $\square$ is not $\mathbf{s} \square$ ecified or e $\square$ uals to $\square$ it reaches the end $\square$ oint directly and no drilling $\square$ ill be cerformed.
3.15. $\square$ autions for canned cycle
(1) The spindle should be rotated (The $\square$ code should be correctly specified, or, the alarm will be generated, the $G \square \square$ by $\square 0 \square$, G8 by $\square 03$ ) by using the miscellaneous function ( $\square$ code) before the canned cycle is executed.
(2) Specifying any command of the $X, Y, Z$ and $R$ data, the hole machining can be performed in the canned cycle of $G \square 3 \square G 8 \square$ If neither data is contained in the block, the hole machining is not performed (G110, G111, G112, G113, G11 $\square, G 115, \mathrm{G} 13 \square, \mathrm{G} 135, \mathrm{G} 13 \square, \mathrm{G} 13 \square, \mathrm{G} 138$ and G13 $\square$ are still needed to specify the corresponding address I, $\square$ and $\square$, or the alarm occurs). But the hole machining is not performed when the $G 0 \square \mathrm{X} \square$ is specified in the circumstance of X , because the X indicates for time when the $G 0 \square$ is specified.

```
G00 X[;
;
```

$\mathrm{G} 81 \mathrm{X} \square \mathrm{Y} \square \mathrm{Z} \square \mathrm{R} \square \mathrm{F} \square \square \square$ ( $\square$ ole machining performs)
$\mathrm{F} \square$; ( F value is refreshed without the hole machining)
$\square \square$; (Performing the miscellaneous function only)
(3) When the canned cycle (G■or G8■) is employed in spindle rotation consolation, if the hole
position ( $\mathrm{X}, \mathrm{Y}$ ) or distance from initial point level to the point R plane is short, and it is necessary to machine serially, or sometimes the spindle can not reach the specified speed before the hole machining operation, for delaying the time, the dwell block by GO $\square$ is inserted into each hole machining, which is shown as follows:

| $\mathrm{GB} \square \mathrm{X} \square \mathrm{Y} \square \mathrm{Z} \square \mathrm{R} \square \mathrm{F} \square ;$ |  |
| :--- | :--- |
| $\mathrm{G} \square \square \mathrm{P} \square ;$ | (For dwell time P, without hole machining) |
| $\mathrm{X} \square \mathrm{Y} \square ;$ | (The next hole is machined) |
| $\mathrm{G} 0 \square \mathrm{P} \square$ | (For dwell time P, without hole machining) |
| $\mathrm{X} \square \mathrm{Y} \square ;$ | (The next hole is machined) |
| $\mathrm{G} 0 \square \mathrm{P} \square$ | (For dwell time P, without hole machining) |

Sometimes, this issue will not be considered according to different machine tool, refer to the manual supplied by the machine tool builder.
( $\square$ ) As stated above, the canned cycle can also be cancelled only when G00 $\square 03$ codes are read. So, there are two cases ( $\square$ expresses for $0 \square 3$, $\square \square$ for canned cycle code) will be shown when they share the same block with the canned cycle G code.
$\mathrm{G} \square \mathrm{G} \square \mathrm{X}-\mathrm{Y}-\mathrm{Z}-\mathrm{R}-\mathrm{Q}-\mathrm{P}-\mathrm{F}-\square-$; (For canned cycle)
Gםロ G X- Y- Z-R- Q-P- F- $\square$-; The $X, Y$ and $Z$ axes are moved by G $\square$ the R, P, Q and $\square$ are disabled, the $F$ is stored. The principle, which the last $G$ code is effective when $G$ codes of same group share the same block, is met by cases above.
(5) When the canned cycle and miscellaneous function are specified at the same block, The $\square$ and $\square F$ codes are delivered at the beginning of positioning (see the Fig. 13.1 (A) for the operation 1). The next hole machining can be performed till the ending signal (FIN) occurs.
( $\square$ ) When the canned cycle is applied, if the tool compensation $\square$ is current state, the tool compensation information $\square$ is then temporarily cancelled and saved; the tool compensation $\square$ status is restored when the canned cycle is cancelled.
( $\square$ ) If the tool length offset commands ( $G \square 3, G \square \square$ and $G \square \square$ ) are specified in a canned cycle block. Then, the offset is performed when the point R plane is positioned (operation 2). The tool length offset commands are disabled after the canned cycle is entered till it is cancelled.
(8) The cautions for the operation of canned cycle:
a. Single block

When the canned cycle operation is performed by using the single block mode, normally, it is separately stopped at the terminal of the movements $1,2,3,4,5$ and 6 in the Fig. 13.1 (A). And the single block is somewhat different according to corresponding canned cycle action at the bottom of a hole. For example, the single block is stopped when the dwell is applied. The operation at the bottom of the hole for fine-milling and rough-milling are divided into multiple single stop. So, it is necessary to startup for several times to machine a hole in a single block.

## b. Feed hold

The feed hold is disabled between the movement $3 \sim 5$ in commands G74 and G84, but the indicator of feed hold will light up. But the control stops till the operation 6. If the feed hold is performed again in operation 6, then it is stopped immediately.

## c. Override

The feedrate override is considered for 100 percent in the operation G74 and G84, the override change is disabled.
(9) When the bit 1 of parameter $3\left(D_{-} R\right)$ is set to 1 , the $D$ value in tool compensation page indicates diameter value.

### 3.15.5 Examples for modal data specified in canned cycle

| No. | Data Specification | Explanation |
| :---: | :---: | :---: |
| N0010 | G00 X_M3 ; | G00 positioning at the rapid traverse, and rotating the spindle; |
| N0020 | $\begin{aligned} & \text { G81 } \mathrm{X}_{-} \mathrm{Y}_{-} \mathrm{Z}_{-} \mathrm{R}_{-} \\ & \mathrm{F}_{-} ; \end{aligned}$ | Because it is the beginning for the canned cycle, so the value needs to be specified for $Z, R$ and $F$. |
| N0030 | Y_; | The corresponding hole machining data is same to the previous hole, only the position $Y$ is different, so G81Z_R_F_ can be omitted. As for the hole position is shifted for Y , hole machining is performed further by using the G81; |
| N0040 | G82 X_ P_; | The hole position needs to be moved along the $X$ axis as for the pervious one. The Z, R and F of previous hole and the P specified by this hole are taken as hole machining data by the G82; |
| N0050 | G80 X_Y_M5 ; | The hole machining is not executed, all of the hole machining data are cancelled (except for the F); The GO positioning is performed with $X Y$; |
| N0060 | G85 X_ Z_ R_P_; | The $Z$ and $R$ are needed to be specified newly because all of the data in previous block are cancelled, the above value specified is applied when the F is omitted. Although the P value is commanded, but it is not needed for this hole machining, so the $P$ value is saved. |
| N0070 | X_Z_; | The $Z$ is different compared with the previous hole, and the hole position just moves along the $X$ axis; |
| N0080 | G89 X_Y_ D_; | The $Z$ and $R, P$ values separately specified by N0070 and N0060, the $F$ value specified in N0020 are taken as hole machining data, which are used for G 89 hole machining. |
| N0090 | G112 I_J_F_D_; | The fine-milling hole machined by G89 is performed by G112. |
| N0100 | G0 X_Y_Z_; | positioning for a rectangle machining |

| N0110 | G134 <br> Z_R_I_J_K_U_D_; | Start machining the rectangle; |
| :--- | :--- | :--- |
| N0120 | Y_I_J_K_U_D_; | Begins machining the second rectangle; |
| N0130 | X_Y_ I_J_K_U_D_; | Begins machining the 3rd rectangle; |
| N0140 | G138 X_Y_R_Z_I | The fine-milling inside the machined rectangle groove is to be <br> performed, the corresponding data are needed; |
|  | J_K_U_D_F_; |  |
| N0150 | G01 X_Y_, | Cancel the hole machining mode and data (except for F); the G01 <br> cutting feed is performed by XY. |

 $13 \square \square 13 \square \square 13 \square$ and $\square 13 \square$ are not sa $\subset$ ed as canned cycle modal data $\square$ so $t \square \mathrm{l} \square \square$ and $\square$ alues need to $\square$ e specified in eac $\square \square$ loc $\square$ or $t \square e$ alarm $\square$ ill $\square$ e generated.

### 3.15. Examples for canned cycle and tool lengt compensation

The hole number from 7 to $10 \ldots$ drilling $\Phi 20$
The hole number from 11 to $13 \square$ boring $\Phi 95$ hole (depth is 50 mm )

The values of offset numbers $\square 11, \square 15$ and $\square 31$ are separately set to 200.0, 190.0 and 150.0, the program is as following:

| N001 G92 X0 Y0 Z0 ; | The coordinate system is set at the reference point |
| :---: | :---: |
| N002 G90 G00 Z250.0 ; |  |
| N003 G43 Z0 $\square 11$; | Plane tool length compensation is performed at the initial plane. |
| N004 S30 M3 ; | The spindle starts. |
| N005 G99 G81 X400.0 Y-350.0 ; <br> Z-153.0 R-97.0 F120.0 ; | $\square 1$ hole is machined after positioning. |
| N006 Y-550.0 ; | 2 hole is machined after positioning, point R plane returned. |
| N007 G98 Y-750.0 ; | $\square$ hole is machined after positioning, initial plane returned. |
| N008 G99 X1200.0 ; | 4 hole is machined after positioning, point R plane returned. |
| N009 Y-550.0 ; | 5 hole is machined after positioning, point R plane returned. |
| N010 G98 Y-350.0 ; | 6 hole is machined after positioning, initial plane returned |
| N011 G00 X0 Y0 M5 ; | Reference point return, the spindle stops. |
| N012 G49 Z250.0 ; | Tool length compensation cancellation |
|  | Initial plane, tool length compensation. |
| N014 S20 M3 ; | Spindle starts |
| N015 G99 G82 X550.0 Y-450.0 ; Z-130.0 R-97.0 P30 F70 ; | $\square 7$ hole is machined after positioning, point R plane returned. |
| N016 G98 Y-650.0 ; | 8 hole is machined after positioning, initial plane returned. |
| N017 G99 X1050.0 ; | 9 hole is machined after positioning, point R plane returned. |
| N018 G98 Y-450.0 ; | $\square 10$ hole is machined after positioning, initial plane returned. |
| N019 G00 X0 Y0 M5 ; | Reference point return, the spindle stops. |
| N020 G49 Z250.0 ; | Tool length compensation cancellation. |
|  | Tool length compensation at initial plane. |
| N022 S10 M3 ; | Spindle starts. |
| N023 G85 G99 X800.0 Y-350.0 ; Z-153.0 R47.0 F50 ; | 11 hole is machined after positioning, point R plane returned. |
| $\begin{gathered} \text { N024 G91 Y-200.0; } \\ \text { Y-200.0 ; } \end{gathered}$ | -12 and $\square 13$ are machined after positioning, point $R$ plane returned. |
| N025 G00 G90 X0 Y0 M5 ; | Reference point return, the spindle stops. |
| N026 G49 Z0 ; | Tool length compensation cancellation |
| N027 M30 ; | Program stops. |

### 3.16 Absolute and Incremental Commands G90 and G91

## ormat

G90; Absolute command
G91; Incremental command

## unction

There are two kinds of modes for commanding axis offset, one is absolute command the other is incremental command. The absolute command is programmed by coordinate value of the terminal position by the axis movement. The incremental command is directly programmed by the movement value of the axis. They are separately specified by G90 and G91 commands.

## Example $\square$

The above movement is programmed by absolute and incremental commands, which is as follows:

G90 X40.0 Y70.0 ; or G91 X-60.0 Y40.0;

### 3.17 Workpiece Coordinate System Setting G92

$\square$ unction The workpiece coordinate system is set by setting the absolute coordinate in current position in the system (It is also called floating coordinate system). After the workpiece coordinate is set, the coordinate value is input in absolute programming in this coordinate system till the new workpiece coordinate system is set by G92.
ommand explanation G92, which is a non-modal G-command;
$X$ : The new $X$ axis absolute coordinate of current position;
Y: The new Y axis absolute coordinate of current position;
$Z$ : The new $Z$ axis absolute coordinate of current position;

Note $\square \square \square \square$ command $\square$ current coordinate $\llbracket$ alue $\square$ ill $\llbracket$ e not c $\square$ anged if $t \llbracket \square \square$ and $\square$ are not
 input $\llbracket$ e coordinate axis not input $\sqsubset$ eeps on $t \sqcap e$ original set $\square$ alue.
3.18 Feed per min. G94, Feed per rev. G95
ormat G94 Fxxxx; $\mathbb{F} \square \sim$ F the leading ero can be omitted the feedrate per min. is offered, mmmin.)
unction The c■tting feedrate is offered in mmmin unit when the G94 is modal G command. The G94 can be omitted if the current mode is G94.
ormat G95 Fxxxx; (F0.0001~ $\square 500$, The leading $\sqsubset$ reo can be omitted)
$\square$ ommand $\llbracket$ unction $\square$ The cutting feedrate is offered in mmrev unit when the G95 is modal G command. The G95 can be omitted if the current mode is G95. The product of $F$ command value ( mm r ) and current spindle speed(rmin) is regarded as the command cutting feedrate to control the actual feedrate when the G95 Fxxxx is performed by system. The actual cutting feedrate varies with the spindle speed. The spindle cutting feed value per rev is specified by G95 Fxxxx, it can form even cutting grain on the surface of the workpiece. The machine should be installed spindle encoder when the G95 mode is used.
G94 and G95 are modal G commands in same group, one of them is effective in one time. G94 is initial modal G command, it is defaulted effective when the power is turned on.

The conversion formula for feed value per rev and per min is as following:

```
                    \(F_{m} \square F_{r} \square\)
Thereinto: \(\mathrm{F}_{\mathrm{m}} \square \square\) eed value per min (mmmin);
    \(\square \square \square\) eed value per rev per rev (mmr);
    S: Spindle speed (r/min).
```

The feedrate value is set by system data parameter No. 030 when the power is turned on for the system; an F value is invariable after the F command is performed. The feedrate is 0 after the F0 is executed. The $F$ value is invariable when the system is reset or emergency stop. $\square$ e feed o erride is memori ed $\square \subset$ en $t \subset$ po $\square$ er is
turned off.
Related parameter:
System data parameter No.029: the exponential acceleration or deceleration time constant for cutting and manual feed;

System data parameter No.030: the lower value of exponential acceleration or deceleration on cutting feed;
System data parameter No.031: The upper limit value for cutting feedrate ( $\mathrm{X}, \mathrm{Y}$ and Z axes)

## Note $\square$

 mode $\square \square \mathbf{e}$ actual feedrate $\square$ as follo $\square$ ing error $\square \square$ en $t \square e$ spindle speed fluctuates. In order to guarantee $\mathbf{t} \square$ e mac $\square$ ining $\square$ uality it is recommended $\mathbf{t} \square \mathrm{at} \mathbf{t}$ e spindle speed can not $\square \mathrm{e}$ lo $\square$
 mac ining.

### 3.19 G98, G99

## ormat $\square$

G98;
G99;
unction
G98; Tool returns to the initial plane when the hole machining is returning.
G99; Tool returns to the point R plane when the hole machining is returning.
Explanation

Modal G command

Refer to the explanation for canned cycle command.

### 3.20 Chamfering Function

A straight line or an arc is inserted into two figures; this is called Chamfering function. The tool can be smoothly transferred from one figure to another. GSK980MD owns two chamfering functions, one is linear chamfering, and the other is arc chamfering.

## 3. $\square$ inear c amfering

The linear chamfering is that a straight line is inserted between figures of the straight lines, the arcs, as well as the straight line and arc. The command address for linear chamfering is $\square$ The data followed by command address $\square$ is the length of chamfering straight line. The linear chamfering should be employed in the G01, G02 or G03 command.

- Cinear to linear

$\square$ ormat $\quad$| G01 | $\mathrm{IP}_{-} \square_{-}$; (IP is axis movement command) |
| :---: | :---: | :---: |

& \text { G02G03 IP_ R_(I_ J_ K_); }
\end{aligned}
$$

unction A straight line is inserted between two arc interpolations.

- $\quad$ ircular to linear
ormat $\square$ G02G03 IP_ R_(I_ J_ K_) $\square_{-}$; G01 IP_;
unction $\square \mathrm{A}$ straight line is inserted between the arc and linear interpolation.

## 3. $\square$ ircular camfering

An arc is inserted between the two linear figures, arc figures or linear and arc figures, this is called circular chamfering. Tangent transition is performed between arc and figure line. The command address is C for the arc chamfering, the data followed by command address C is the radius of chamfering arc. The arc chamfering should be employed in command G01, G02 or G03.

- 1. inear to linear
ormat $\square$
G01 IP_ C_;
G01 IP_;
unction An arc is inserted between two linear interpolations, which it is tangential with two linear lines, the data followed by command address C is radius.

- $\quad \square$ inear to $\square$ ircular ormat $\square$

G01 IP_ C_;
G02G03 IP_ R_(I_ J_ K_) ;
unction An arc is inserted at the intersection of straight line and arc, this arc is tangential with both the straight line and arc, the data followed by command address $C$ is radius.

- 3. $\square$ ircular to $\square$ ircular ©ormat $\square$

$$
\begin{aligned}
& \text { G02 G03 IP_ R_(I_ J_ } \begin{array}{ll}

\text {G02 G03 } & \mathrm{IP}_{-} \\
R_{-}\left(\mathrm{I}_{-}\right. & \mathrm{J}_{-} \\
\left.\mathrm{K}_{-}\right)
\end{array}
\end{aligned}
$$

unction $\square$ An arc is inserted between two arc interpolations which it is tangential with two circulars, the data followed by the command address $C$ is radius.

- $\square$. $\quad$ ircular to inear ormat $\square$
G02G03 IP_ R_(I_ J_ K_) C_;
G01 IP_;
unction An arc is inserted at the intersection of arc and straight line, which is tangential with the
arc and straight line; the data following the command address C is radius.

## 3. $\square .3$ Exceptional $\square$ ases

The chamfering function is ineffective or alarm is issued in the following circumstances:

1. inear c amfering
$\square$. The chamfering function is ineffective when two interpolation lines is shown on the same line.
$\square$. If the chamfering linear length is too long, and the CNC alarm occurs.

$\square$. If some line ( $\operatorname{arc}$ ) is too short, the alarm occurs.

$\square . \square \mathbf{r c} \square \square$ amfering
$\square$. The arc chamfering function is disabled when two interpolation lines are shown on the same line.
$\square$. If the chamfering radius is excessive, the CNC alarm occurs.

$\square$. The arc chamfering function is disabled when the line is tangential with arc or the arc is tangential with line.

D. The arc chamfering function is disabled when the arcs are tangent.

Note $1 \square \square e$ c $\square$ amfering function can $\llbracket$ e performed only in $t \square e$ plane specified $\llbracket 1 \square \square 1 \square$ or $\square 1 \square t$ ese functions can not $\square$ e performed in parallel axes.
Note $\square \square \square \square$ anging t $\square$ e coordinate system $\llbracket y \square \square$ or $\square 5 \square$ to $\square 5 \square$ or $\square \square$ e $\square$ loc $\square$ follo $\square$ ed $\llbracket y$ performing $t \subset e$ reference point return from $\square \square$ to $\square \mathbf{3} \square$ can not specify $\mathbf{t} \square \mathbf{e}$ camfering. Note $3 \square \square a m f e r i n g$ function can not $\llbracket e$ employed in $t \llbracket$ DN mode.

### 3.21 Rigid Tapping

The right-handed tapping cycle (G84) and left-handed tapping cycle (G74) may be performed in standard mode or rigid tapping mode. In standard mode, the spindle is rotated and stopped along with a movement along the tapping axis using miscellaneous functions M03 (rotating the spindle cloclwise), M04 (rotating the spindle counterclockwise), and M05 (stopping the spindle) to perform tapping.

In rigid mode, tapping is performed by controlling the spindle motor as if it were a servo motor and by interpolating between the tapping axis and spindle. When tapping is performed in rigid mode, the spindle rotates one turn every time a certain feed (thread lead) which takes place along the tapping axis. This operation does not vary even during accleration or deceleration.

## 3. 1.1 igid apping

 $\square$ ode format $\square$Ceft-handed rigid tapping: G74 X_Y_Z_R_P_F (I) _ $\quad$ _

Right-handed rigid tapping: G84 X_Y_Z_R_P_F (I) _ $\square$ C_
$\square$ ode function $\square$ In rigid mode, tapping is performed by controlling the spindle motor as if it were a servo motor and by interpolating between the tapping axis and spindle. When tapping is performed in rigid mode, the spindle rotates one turn every time a certain feed (thread lead) which takes place along the tapping axis. This operation does not vary even during accleration or deceleration.
$\square$ ycle process $\square(1)$ Position to the XY plane at the rapid traverse rate;
(2) Reduce to the point R plane rapidly, then to the position where the $C$ is specified at the rapid traverse rate;
(3) Tapping is performed to the bottom of the hole, then the spindle stops;
(4) Dwell time $P$ is performed if the $P$ is specified;
(5) Spindle rotates reversely returns to the point R plane, the spindle then stops; dwell time $P$ is performed if the $P$ is specified;
(6) Return to the origin plane if the command is G98;
$\square$ ode pat $\square \square \mathbf{s} \square \mathbf{s}$ a sample

## Explanations

When the tapping operation 3 is being performed, the feedrate override can not be adjusted; when the operation 5 is perfoming, the speed override value is set by the data parameter 084, when the data parameter 084 is set to 0 , the override value is fixed as $100 \square$

When the tapping operation 3 is being performed, the linear acceleration or deceleration constant value is set by the data parameter 082; when the tapping operation 5 is performed, the linear acceleration constant value is set by data parameter 083, if the data parameter 083 is se to 0 , the linear acceleration deceleration time constant in operation 5 is set by the data parameter 082.

## 3. $\square$ 1. Pec $\square$ igid $\square$ apping

## $\square$ ode format $\square$

( $\square$ igh-speed standard) peck left-handed rigid tapping: $G 74 X_{-} Y_{-} Z_{-} R_{-} P_{-} F(I) \square_{-} \square_{-} C_{-}$
( $\square$ igh-speed standard) peck right-handed rigid tapping: G84 X_Y_Z_R_P_F (I) _ $\quad \square_{-}$C_
ode function When the peck tapping is performed in rigid tapping, due to chips sticking to the tool or increased cutting resistance, in such cases, the preferable tapping can be performed by the peck rigid tapping.

## $\square$ ig speed pec $\square$ rigid tapping

When the RTPCP of state parameter No. 025 is set to 1 , the high-speed peck rigid tapping cycle is selected.

After positioning along the X - and Y -axes, rapid traverse is performed to point R , then position to the place where specifies by C. From point $R$, cutting is performed with depth $\square$ (depth of cut for each cutting feed), then the tool is retracted by distance d, the retraction speed can be overridden. When point $Z$ has been reached, the spindle is stopped, and then rotated in the reverse direction for retraction. The tool retracts to the point R , the spindle stops. If it is G 98 state, rapidly move to the initial position, the Figure is shown below:

## Standard pec rigid tapping

When the RTPCP of state parameter No. 025 is set to 1 , the standard peck rigid tapping cycle is selected.

After positioning along the X - and Y -axes, rapid traverse is performed to point R , then position to the place where specifies by $C$. From point $R$, cutting is performed with depth $\square$ (depth of cut for each cutting feed), then the tool is retracted by distance $d$, the retraction speed can be overridden. The position is performed from point $R$ to a distance $d$ from the end of the last cutting, which is where cutting is restarted, and the cutting feed is performed. When point $Z$ has been reached, the spindle is stopped, then rotated in the reverse direction for retraction. The tool retracts to the point R, the spindle stops. If it is G98 state, rapidly move to the initial position, the Figure is shown below:

## Explanations

When tapping feed is performing, the speed override can not be adjusted; when the retraction is
performed, the speed override value is set by data parameter 084, when the data parameter 084 is set to 0 , the override value is fixed as $100 \square$.

The linear acceleration or deceleration constant value in tapping feed is set by data parameter 082, the linear acceleration or deceleration constant in retraction is set by data parameter 083, if the 083 is set to 0 , the acceleration or deceleration constant in retaction is then set by data parameter 082. The start speed both tapping feed and retraction are set by data parameter 081, and the retraction distance d is set by data parameter 085 .

## 3. $1.3 \square$ ddress Explanation

| Specified content | Address | Command address explanation |
| :---: | :---: | :---: |
| -ole position data | X, Y | Specify the hole position by the absolute value or incremental |
| Aparture machining data | R | From the initial plane to the point distance |
|  | Z | Depth of a hole, the distance from point R to the bottom of the hole |
|  | P | Specify the dwell time at the bottom of the hole or at point R when a return is made. The dwell does not perform when it is not input or the value is 0 . |
|  | $\square$ | Tool infeed value of peck tapping |
|  | $\square$ | It indicates that the consecutive maching cycle of $\square$ holes are performed on this line segment from start (the start position of block) to XY coordinate position. The continued drilling may not perform if it is not input or the value is 0 . |
|  | F | Metric thread leading, the solution range: 0.001~500mm. The alarm 201 may alarm if it is not input. |
|  | 1 | The number of the thread head perinch, the solution range is 0.06~25400 gear İnch |
|  | C | Start angle |

## 3. $\square$. $\square$ ec nic Specification

- Accelerationdeceleration

Rigid tapping adopts the acceleration or deceleration before a straight line to control.

- Override

The override regulation is invalid for rigid tapping infeed, but the override value can be adjusted or not which is determined by data parameter.

- Dry run

G84 G74 can be used a dry run, the dry run e $e$ uals to the feedrate along $Z$ axis. The override adjustment is invalid in dry run.

- Machine lock

G84 G74 can be used a machine lock, the tapping axis and spindle axis are not moved when the machine lock is enabled.

- Resetting

The resetting can be reset the tapping when the rigid tapping is performed, but the G74 G84 can be not be reset.

- Dwell

The dwell is disabled.

- Working

G84 G74 is only valid in Auto or MDI mdoe.

- Manual feed

The rigid tapping can not used for manual feed.

- Tool length compensation

If the tool length compensation (G43, G44 or G49) is specified in canned cycle, the offset value is added till position to the point R.

- Cutter compensation

Cutter compensation is ignored in canned cycle.

- Axis switching

The $Z$ axis tapping can only be performed in rigid mode.

- S code

If the command speed is more than the maximum speed, the alarm may occur.

- M29

Specify an axis movement code between M29 and G84 G74 causes alarm.

- P 四

If they are specified in non-drilling block (If they are specified in a block that does not perform drilling), they are not stored as modal data. When $\square 0$ is specified, the peck rigid tapping cycle is not performed.

Specify them in tapping block, they are stored as modal data, when the tapping command is retracted, either $\square$ modal (did it).

- Cancellation

Do not specify a group 01 G code and G84 G74 in the same block.

- A Cs contour control is used with rigid tapping at the same time.

CS axis selects a speed mode or position mode which is determined by CON (G27.7), but, the system is rigid tapping mode, regardless of the value of CON. After the rigid tapping is cancelled, the rotation axis is either CS axis or common one which is determined by state parameter. The C axis can not be moved in manual mode when the rigid tapping is not cancelled.

## 3. 1.5 Specify a igid $\square$ apping $\square$ ode

- Specify M29 before G74 G84

G84 shows a sample for the following time-se $\sqsubset u e n c e$

- Specify M29 and G74 G84 at the same block

G84 shows a sample for the following time-se $\sqsubset$ uence

- The explanation of time se $\sqsubset u e n c e$

The spindle rotation operation means that the rotation axis is shifted to the position control mode (namaly, the servo spindle is needed to send a switch signal in position mode), and check the position mode arrial signal of servo spindle.

## 3. $1 . \square \square$ e cancellation of rigid tapping mode

- The rigid tapping mode is canceled by G80
- Specify other canned cycles by $G$ codes
- The other G codes of group 1 .
- CNC resetting

The signal descending of F 76.3 along the signal with canceling the rigid tapping of $\mathrm{P} \subset \mathrm{C}$, if the state RTCRG of parameter 025 is e $\sqsubset$ ual to 1 , the system is then performed the next block without waiting for the rigid tapping mode signal which G61.0 is set to 0 ;

When the state parameter 025.2 (CRG) $\square 0$, the time se $\square$ uence is as follows:

When the state parameter 025.2 (CRG) $\square 1$, the time se $\sqsubset u e n c e$ is as follows:

## 3. $\square 1 . \square$ and $\square$ Signals

RGTAP (G61.0): Rigid tapping signal
When the M 29 is commanded, PMC enters the rigid tapping mode, and the signal is then set to 1 to inform the CNC

1: PMC enters the rigid tapping mode
0 : PMC does not enter the rigid tapping mode
If this signal does not set to 1 , after the M29 has been commanded, the alarm may occur in the block of G74 G84.
RGSPM, RGSPP (F65.1, 0) spindle turning signal
When the rigid tapping is performed, the signal is informed to the PMC whether the current spindle is CCW (positive) or CW (negative).

RGSPM: 1 spindle CW (negative) RGSPP: 1 spindle CCW (positive)
In rigid tapping, these signals are output when the spindle is rotated. In the mode of rigid tapping, when the spindle is positioned at the hole or stoppted at the bottom of the hole or R position, these signals are not output.

In the mode of rigid tapping, when the spindle is positioned at the inter-locked stop, machine lock or Z axis ignorance states, the spindle does not regard as a stop state, in this case, these signals are output. These signals are only enabled in rigid tapping, and they are all set to 0 in the normal spindle control mode.

RTAP (F76.3): Rigid tapping process signal
This signal informs PMC which has been in the mode of rigid tapping or not. The CNC is in the mode of rigid tapping currently when the signal is set to 1 .

This signal can be locked M29, P■C has been commanded the rigid tapping mode, the PMC is then treated with the correspinding logic, and this signal can be replaced the lock of M29, even so, the FIN singl of M29 is not ignored still.

## 3. $1 . \square$ larm essage

| $\begin{aligned} & \text { larm } \\ & \text { No. } \end{aligned}$ | Display ontent | Explanation |
| :---: | :---: | :---: |
| 218 | Fail to specify the tool pitch F value in G74 or G84 | Fail to specify F value |

M30;

## $C \square A P T \square R 4$ CONTRO $\square$ FUNCTION of ADDITIONA $\square$ AXIS

### 4.1 General

The additional axis is determined by the struction design of the machine, sometimes, an additional axis is re uired, for example, the cycle working table, rotation working table. This axis can be designed as both a linear axis and rotation axis. The basis controllable number of 980MDa is three axes, the maximum axis is 5 -axis (Cs axis included). Namely, two additional axes are added based upon the original one $\square \square$ the $4^{\text {th }}$ and the $5^{\text {th }}$ axes, in this case, the relative functions of additional linear axis and rotation axis can be performed.

### 4.2 Axis Name

The names of three basis axes are always $\mathrm{X}, \mathrm{Y}$ or Z . The axis name of additional axis can be set to A, B or C using data parameter No. 202 and No. 203.

- Default axis name

When the axis name does not set, the axis name of the $4^{\text {th }}$ one is an additional axis by default; the axis name of the $5^{\text {th }}$ one is C .

- $\quad$ epeated axis name

When the axis name is same between the added $4^{\text {th }}$ axis and the $5^{\text {th }}$ axis, $P S$ alarm may issue.

### 4.3 Axis Display

When the additional axis is treated as rotation axis, the least incremental of the rotation axis is $0.01 \square$ (degree), so the $3^{\text {rd }}$ digit of the decimal is displayed in unit. If it is set to a linear axis, the display is same as the basis three axes ( $\mathrm{X}, \mathrm{Y}$ or Z ). When the $4^{\text {th }}$ axis is set to a linear axis, the $5^{\text {th }}$ is set to a rotation axis, the axis is displayed at the interface of related coordinate $\square$ and coordinate $\square$ program $\square$.

### 4.4 Axis Startup

The Bit 1 (ROSx) of data parameter No. 026 and Bit0 (ROTx) of data parameter No. 028 are separately set to use whether the $4^{\text {th }}$ axis and the $5^{\text {th }}$ axis is either the linear axis or rotation axis. The parameter settings are shown below:

| $\square \square \mathbf{S}$ | $\square \square \square$ | ontent |
| :---: | :---: | :--- |
| $\square$ | $\square$ | $\begin{array}{l}\text { inear axis } \\ \text { 1. It can be switched between metric and inch; } \\ \text { 2. All of the coordinate values are linear axis; } \\ \text { 3. The stored pitch error compeneation is linear axis. }\end{array}$ |
| $\square$ | $\mathbf{1}$ | $\begin{array}{l}\text { Rotation axis (Type A) } \\ \text { 1. It can not be switched between metric and inch; } \\ \text { 2. The machine coordinates are cycled based on the setting value } \\ \text { of data parameter No.189 No.190. Whether the absolute } \\ \text { coordinate and relative coordinate are cycled which based } \\ \text { upon the data parameter No.027 No.029; }\end{array}$ |
| $\mathbf{3 . T h e ~ s t o r e d ~ p i t c h ~ e r r o r ~ c o m p e n s a t i o n ~ i s ~ r o t a t i o n ~ a x i s ; ~}$ |  |  |
| 4. The movement amount is less than one turn when the reference |  |  |
| position (G28, G30) is returned. |  |  |$]$| I Ineffective setting (forbidden) |
| :--- |

Note

### 4.5 The Additional Axis is Inear Axis

When the additional axes (the $4^{\text {th }}$ and the $5^{\text {th }}$ axes) are set to linear axes, its functions are same as the basis three axes.

- $\square$ eali $\sqsubset$ ale operation

1. Rapid traverse (Positioning): G9091 G00 $\mathrm{X}_{-} \quad \mathrm{Y}_{-} \quad \mathrm{Z}_{-} \quad \mathrm{A}_{-} ;$
2. Cutting feed: G9091 G01 $X_{-} \quad Y_{-} \quad Z_{-} \quad A_{-} \quad F_{-} ;$
3. Skip function: G9091 G31 $\mathrm{X}_{-} \quad \mathrm{Y}_{-} \quad Z_{-} \quad \mathrm{A}_{-} \quad \mathrm{F}_{-} ;$

4．Reference position return：G282930 $\mathrm{X}_{-} \quad \mathrm{Y}_{-} \quad Z_{-} \quad \mathrm{A}_{-} \quad \mathrm{F}_{-}$；
5．G92 coordinate setting：G92 $X_{-} \quad Y_{-} \quad Z_{-} \quad A_{-}$；
6．Manual StepIMPG feed，Manual machine זero return．
 linear axes are expressed $\square$ it $\square \square \square$ ．

## －Explanations

1．When the additional linear axis rapidly moves or performs，it can be simultaneously specified with any axes of $X, Y$ and $Z$ ．$\square$ ach axis may rapidly move at its customi ed speed．

2．When the additonal linear axis is performed the cutting feed（G01）or used a skip function （G31），it can be simultaneously specified with any axes of $X, Y$ and $Z$ ．in this case，the linear axis does not has an individual feedrate $F$ but depend on each axis specified at a same time，which it is started or ended together with the specified each axis；namaly，the additional axis is shared with the basis three－axis linkage．

3．The additional linear axis can not performed a circular arc cutting（G0203），otherwise，the PS alarm may occur．

4．The pitch error of additional linear axis and the compensation function of inverse interval are same as the basis three－axis．

## 4．6 The additional axis is rotation axis

## －Input unit

The pulse e uivlance（namally，the least input unit）of 980MDa rotation axis is $0.01 \square$（degree）； the maximum vlaue of output pulse fre $\quad$ uence is 500 K ．
When the selection is output based on the direction of pulse adding，it can be inputted a maximum speed n 60 f $36000 \square 833.33$（rev．min．）

## －$\square$ otation axis speed

The feedrate of rotation axis is regarded the degreemin．as a unit．When the linear axis $\mathrm{X}, \mathrm{Y}$ and $Z$ is performed a linear interporlation with the rotation axis，the speed specified with $F$（ $\mathrm{mm} / \mathrm{min}$ ）is the compound feedrate both $\mathrm{X}, \mathrm{Y}$ and Z and the rotation axis．

Feedrate calculation：Calculate the re －uired time when the feedrate is performed to the end；then， the feedrate unit of rotation axis is changed into degreemin．．

For example：G91 G01 X20．0 C40．0 F300．0；
The unit of $C$ axis is switched into 40 mm from the 40.0 degree．The re $\sqsubset u$ uired time to the end is：

$$
\frac{\sqrt{\square+\square}}{\square \square \square}=\square ⿴ 囗 \square \text { (min.) }
$$

The speed of $C$ axis is：

$$
\frac{\square}{\square ⿴ 囗 \square \square \square \square \square ा}=\text { (degree/min.) }
$$

 linear axes are expressed $\square \mathrm{it} \square \square \square$.

## －e cycle function of rotation axis

The coordinate cycle function of the additional rotation axis setting is enabled，which can be
avoided the coordinate value is overflowed from the rotation axis; the coordinate value will be cycled based on the setting value of data parameter No.189 No. 190 (the movement amount of each axis for the rotation axis).

When the coordinate cycle function of the additional rotation axis setting is disabled, the coordinate value may change based on the linear axis, the programming command is also same to the one of the linear axis;

Two kinds of coordinates change are shown below:
(1) When the coordinate cycle is disabled:

The above-mentioned may occur: 1. The machine coordinate value of rotation axis (Type B)
2. The absolute coordinate value in data parameter No. 027 ROAx $\square 0$ (absolute coordinate cycle function is disabled)
3. The relative coordinate value in data parameter No. $027 \mathrm{RR} \llbracket \mathrm{x} \square 0$ (relative coordinate cycle function is disabled)
(2) When the coordinate cycle is enabled:

The above-mentioned may occur: 1. The machine coordinate value of rotation axis (Iype A) 2. The absolute coordinate value in data parameter No. 027 ROAx $\square 1$ (absolute coordinate cycle function is enabled)
3. The relative coordinate value in data parameter No. 027 RR■x $\square 1$ (relative coordinate cycle function is enabled)

Note 1: Refer to the Section of "Installation and connection" of the Parameter Explanation of Chapter Three for the parameter setting of additional rotation axis.

Note 2: When there is no special explana ion in $\square \mathbf{u b}$ equen narration, the movement amount of each revolution of the additional rotation axis is expressed with $360^{\circ}$.

## - The pitch error compensation function of rotation axis

When the additional axis is a linear axis or rotation axis (Type B), the pitch error compensation mode is same as the common linear axis. The pitch error compensation function is performed when the additional axis is regarded as rotation axis (Type A), refer to the following examples:

- Movement amount per revolution: $360^{\circ}$
- Pitch error pisition interval: $45^{\circ}$
- The compensation position number of reference position: 60

After the above parameters are set, the farthest compensation position number along the negative rotation axis which equals to the compensation position number of reference position;

The farthest compensation number along positive direction is shown below:
The compensation position number of reference point + (movement amount per revolution/compensation position interval) $=60+360 / 45=68$;

The corresponding relationships between machine coordinate and compensation position number are as follows:

The position error may occur if the total of compensation value from position $6 \square 68$ is not 0 ; there is not alternative other than to set a same value at the compensation position both 60 and 68. (Because the 60 and 68 are shared a same position at the circle);

The compensation sample is shown below:

| $\mathbf{N} \square$. | 60 | $6 \square$ | $6 \square$ | 63 | 64 | 65 | 66 | $6 \square$ | 68 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Compensation <br> value | $\square$ | $-\square$ | $\square$ | 3 | $-\square$ | $-\square$ | -3 | $\square$ | $\square$ |

- The reverse interval compensation function of rotation axis

The reverse interval compensation never changes regardless of the linear axis or rotation axis; however, the compensation unit of the rotation axis is $0.0 \square^{\circ}$ (deg), and the linear axis is $0.00 \square(\mathrm{~mm})$;

## 4. $\square$ The $\sqsubset$ ero return $\square$ of rotation axis

The selection axis has four ero return methods: $\sqsubset$ ero return method $A, B, C$ and $\square$. Wherein, the $\sqsubset$ ero return methods $A, B$ and $C$ are same as the one of the linear axis. $\square$ nly the $\square$ is a special $\sqsubset$ ero return method for the rotation axis.

## - Setting of the ero return method $\square$

The method $\square$ is only valid to the rotation axis.
$\square$ ero return can be performed for this rotation axis using the mode $\square$ after the $4^{\text {th }}$ and the $5^{\text {th }}$ axes are set to rotation axes based on the Bit6 of data parameter $\square 0.0 \square$ and $\square 0.0 \square \square$ are set to $\square$.
ff the $4^{\text {th }}$ and $5^{\text {th }}$ axes are disabled or linear axes, then the Bit6 of state parameter $\square 0.0 \square \square$ and $\square 0.0 \square$ are invalid.

$=0$ : The rero return mode of the $5^{\text {th }}$ rotation axis is used the mode $A, B$ and $C$.

- The time sequence and process of the rero return mode $\square$

The process of Cero return
$\square$. $\sqsubset$ elect the machine $\sqsubset e r o$ return mode and press the manual positive feed $\llbracket$ ey, the corresponding axis moves toward the זero point at the rapid traverse rate.
$\square$ When the one-turn signal (PC) of servo axis is carried out, the system is decelerated to the rero return low speed, in this case, chec $\square$ the trailing edge of PC signal.
3. The system continuously and forward operates in the rero return low speed.
4. When the system meets one-turn signal (PC) of servo axis again, the movement stops, simultaneously, the corresponding indicator of rero return end on operator panel goes on. The machine $\sqsubset$ ero return operation ends. nn this case, chec the rising edge of PC signal.

### 4.8 The $\square u n c t i o n ~ o f ~ C s ~ A x i s ~$

## eneral

The spindle is treated as the servo feed axis to rotate and position by the position movement command. $\square u n$ speed is: degree/min., it can be interpolated together with other feed axes to machine a contour curve.

Increment s stem: the least input increment: $0.0 \sqcap$ deg
The least command increment: $0.0 \sqcap \mathrm{deg}$
xplanation: $\square \mathrm{C}$ has two control modes for the spindle.

- $\square$ pindle speed control mode. The spindle speed can be controlled by the speed command ( $\square$ amely, analog voltage).
- $\square$ pindle contour control mode ( $\ddagger$ is also called $\mathrm{C} \square$ contour control). The spindle position can be controlled by the position command ( $\square$ amely, position pulse).
$\square 0, \square \mathrm{C}$ is required the spindle servo control unit has two control modes for the control of the spindle motor
- When $\square \mathrm{C}$ is at the speed control mode for the control of the spindle, the spindle servo control unit can receive a speed command issued from $\square \mathrm{C}$ to control the rotation speed of spindle motor.
- When $\square \mathrm{C}$ is at the contour control mode for the control of the spindle, the spindle servo drive unit also can receive a position command issued from $\square \mathrm{C}$ to control the motor operates to a specified position.

## Set $\square$ s contour control axis

In the $\square 80 \mathrm{M} \square$ a system, only the additional axis (the $4^{\text {th }}$ or the $5^{\text {th }}$ axis) can be set to a Cs contour control axis. But, two Cs axes can not be set at the same time. Before the Cs axis setting is valid, this axis must be set to a rotation axis. $\square$ therwise, Cs axis setting is invalid.

$\square C \square 4=\square$ : The $C \square$ axis function of the $4^{\text {th }}$ axis is enabled; $=0$ : The $C \square$ axis function of the $4^{\text {th }}$ axis is disabled.
$\square \square \square 4$, $\square \square T 4$ : $\square$ et the type of the $4^{\text {th }}$ axis;

|  | inear <br> axis | Tpe $\square$ <br> rotation <br> axis | Tpe $\square$ <br> rotation <br> axis | Invalid |
| :---: | :---: | :---: | :---: | :---: |
| $\mathbf{R} \square \mathbf{T} \square$ | 0 | $\square$ | $\square$ | 0 |
| $\mathbf{R} \square$ | 0 | 0 | $\square$ | $\square$ |

$\square \mathrm{C} \square 5=\square$ : The $\mathrm{C} \square$ axis function of the $5^{\text {th }}$ axis is enabled.
$=0$ : The $\mathrm{C} \square$ axis function of the $5^{\text {th }}$ axis is disabled.
$\square \square \square 5$, $\square \square \mathrm{T} 5$ : $\square$ et the type of the $5^{\text {th }}$ axis;

|  | inear <br> axis | Tpe $\square$ <br> rotation <br> axis | Tpe $\square$ <br> rotation <br> axis | Invalid |
| :---: | :---: | :---: | :---: | :---: |
| $\mathbf{R} \square \mathbf{T} \square$ | 0 | $\square$ | $\square$ | 0 |
| $\mathbf{R} \square$ | 0 | 0 | $\square$ | $\square$ |

The switch between spindle speed control and $\square \mathbf{S}$ contour control
The $\square \mathrm{C}$ switching of spindle control mode is performed by the $\mathrm{C} \square \square$ signal of $\mathrm{P} \subset \mathrm{C}$. n the $\mathrm{C} \square$ contour control mode of $\square \mathrm{C}$, the $\mathrm{C} \square$ contour control axis, as the common servo axis, can be performed manually or automatically.

- $\square$ rom spindle speed control shifts to the Cs contour control $\square$ et the $C \square \square(\square 0 \square \square \square)$ to $\square$, then the spindle can be set in the Cs contour control mode. ff the switch is performed during the spindle rotation, the spindle is immediately stopped and then shifts.
- $\square$ rom Cs contour control shifts to the spindle speed control $\square$ et the $\mathrm{C} \square \square(\square 0 \square \square \square)$ to 0 , the spindle is then set in the spindle speed control mode. Confirm the spindle movement command has been ended before shifting, if the shift is performed when the spindle is being moved, the system will alarm.
The reference position return of $\square \mathbf{s}$ contour control axis
After the spindle is shifted to the Cs contour control mode from the speed control mode, the current position is not confirmed, the spindle should be returned to the reference position.
The reference position return of Cs contour control axis is as follows:
- Manual reference position return

After the spindle enters the Cs contour control mode, shift to the machine rero return mode. The rero return of Cs axis is performed opening the feed axis and the direction selection signal $+\square \mathrm{n}(\square \square 00)$ or $-\square \mathrm{n}(\square \square 0 \square)$.

- Automatic
$\square$ pecify $\square 8$ after the spindle enters the Cs contour control mode, and the spindle moves to the intermediate point and then return to the reference position.
$\square \mathrm{Pn}(\square 0 \square 4)$ becomes $\square$ after the referece position return is executed.

## The operation of $\square \mathbf{s}$ contour control axis

$\square$ anual utomatic $\square$
ff the Cs contour control axis has been returned to the reference position, the operation of Cs axis is same as the common $\square \mathrm{C}$ axis.
n the spindle speed control, the Cs contour control axis can not be performed. $\square$ therwise, the system alarms.
$\square \mathrm{o}$, in the spindle speed control mode, it is not permitted the manual operation of Cs by the $\mathrm{P} \subset \mathrm{C}$ ladder diagram.

## The signal shift of spindle contour control

$\square \square \mathbf{N} \mathbb{0 2}$ $\qquad$
Type $\square i g n a l$ input
Tunction $\square$ This signal is used for shifting between spindle speed control mode
and Cs contour control mode.
When this signal is set to $\square$, the spindle is shifted to the Cs contour control mode from speed control mode.
When this signal is set to 0 , the Cs contour control mode comes bac $\square$ to the speed control mode.

## The signal shift end of spindle contour control

$S \square S \square 0 \square 1 \square$

## Type $\square$ ignal output

Wunction $\square$ This signal indicates that the controlled axis has been controlled under the Cs contour.
Tutput condition $\square \square$ pindle speed control mode $-\square 0$
Cs contour control mode - $\square \square$
$\mathrm{N} \square$ and spindle servo control unit
The signal shift relationship of the spindle wor ing

Time sequence figure

## Relative parameter

- The explanation of "two points same"
$\square$ adius compensation mode is pre-read two bloc $\llbracket$ s. Caculate the transit point and perform a path movement ta $\llbracket$ ing 3 position points (the start of the $\square^{\text {st }}$ bloc $\square$ the intersection of the $\square^{\text {st }}$ and the $\square^{\text {nd }}$ bloc $\llbracket$ s, the end of the $3^{\text {rd }}$ bloc $\square$ ). nn this case, two same points $\square$ may occur in the following items:
(a) The first two points are same when starting.
(b) The last two points are same when starting.
(c) The first two points are same during the compensation.
(d) The last two points are same during the compensation.
(e) The first two points are same during the retraction.
(f) The last two points are same during the retraction.

The two same points $\square$ is regarded the point as a linear of which approximates to ero, when the two same points $\square$ occurs, the transit point calculation can be performed based on the straight line (point) to straight line (point), straight line (point) to circular arc (point), circular arc (point) to straight line (point) and circular arc (point) to circular arc (point).

## $\square \square \square \square \mathbf{T} \square \mathbf{R} \square \square \square \square \mathbf{R} \square \square \mathbf{R} \square \square \mathbf{R} \square \square$

$80 \mathrm{M} \square$ a provides macro programs which is similar to high level language. $\square a r i a b l e$ assignment, arithmetic operation, logical udgment and conditional branch can be reali $\sqsubset$ ed through custom macro program. It is in favor of the programming for special parts, lessens the complex operation and simplifies the custom program.

Custom macro programs are similar to subprograms. $\square$ owever, macro program allows variable assignment, arithmetic operation, logical udgment and conditional branch, which ma es it easier to program the same machining process.

$\square 0$ and 5 respectively call macro program and define variables $\square \square$ and $\sqsubset 4$

t is easy to machine the screw holes distributed in circles (shown in the figure above).
After a macro program used in circular holes is programmed and edited, it can be performed if the $\square$ C system has circular hole machining function.
By the following command, programming personnel can use circular holes function.
$\square 65$ Pp. $\square \underline{r} A \underline{a} B \underline{b} \square \square ;$
p : Macro program number of circular holes
r: ■adius
a: $\square$ tart angle of the hole
b: Angle of holes intervals
■: $\square$ oles number
n this way, users can improve the $\square \mathrm{C}$ performance on their own. Macro programs can be either provided by machine tool builder or defined by users.

## 5. Macro Call

Macro call ( $\square 65, \square 66$ ) differs from subprogram call (M $\square$ ) as described below:
$\square$ With $\square 65$ or $\square 66$, an argument (data passed to a macro) can be specified. M $\square$ does not have this capability.
$\square$ When an M $\square$ bloc $\square$ contains another $\square \mathrm{C}$ command (for example, $\square 0 \square \square \square 00.0 \mathrm{M} \square 8 \mathrm{P}$ ), the macro program $\mathrm{P} \square$ is called after the command $\square 0 \square$ is executed. $\square \mathrm{n}$ the other hand $\square 65$ unconditionally calls a macro $\mathrm{P} \square$.
3. When an $\mathrm{M} \square 8$ bloc $\square$ contains another $\square \mathrm{C}$ command (for example, $\square 0 \square \square 00.0 \mathrm{M} \square \mathrm{P} \square$ ), the machine stops in the single bloc $\square$ mode. $\square \mathrm{n}$ the other hand, $\square 65$ does not stop the machine.
4. With $\square 65$ or $\square 66$, the level of local variables changes. With $\mathrm{M} \square$, the level of local variables does not change.

- Non modal call ( $\square \square$ )

When $\square 65$ is specified, the macro program specified at address P is called. Argument (data) can be passed to the custom macro program.
ormat: $\square 65 \mathrm{P} \square \square \square \square$ argument $\square \square$;
xplanation: $\mathrm{P} \square \square$ number of the program to be called
$\square \square \square$ repetition count ( $\square$ by default, $\square$ to $\square \square$ can be specified)
Argument $\square \square \square \square$ ata passed to the macro. ts value is assigned to the corresponding local variables.

$\square$ rgument specification: two t $\lceil$ pes of argument specification are available.

Argument specification $\square$ it uses letter other than $\square, \square, \square, \square$ and $P$ once each. n repeated specification, the last one prevails.
Argument specification $\square$

| Address | Variable <br> number |
| :---: | :---: |
| A | $\# 1$ |
| B | $\# 2$ |
| C | $\# 3$ |
| D | $\# 7$ |
| E | $\# 8$ |

Note 1: Subscripts of $I, \square$ and $\square$ for indicating the order of argument specification are not written in the actual program.
Note 2: $\square$ rgument I, $\square, \square$ do not need to be written in orders. The $\square$ will be identified according to the present sequence. $\sqcap$ or example: $\square 6 \square \square 010 \square 1 \square 2 \square 3$ I1 $\square \square \square 16 \square \square$ $\square \square \square 11 \square 12 \square$ The variables are passed as follows:
$\mathrm{I} \square \rightarrow \square, \square 1 \square \rightarrow \square, 16 \rightarrow \square \square, \square \rightarrow \square \square, \square \square \rightarrow \square, \square 11 \rightarrow \square \square, \square 12 \rightarrow \square 12, \square 30 \rightarrow \square 11$;
ormat: $\square 65$ must be specified before any argument.
$\square$ ixture of argument specifications I and II: The $\square \mathbf{N} \square$ internall $\square$ identifies argument specification I and II. If a mixture of argument specification I and II is specified, the $t$ pe of argument specification specified later ta precedence.

$\square$ odal call ( $\square 66$ )
$\square$ nce $\square 66$ is issued to When both 14 and D5 arguments are commanded forbloc $\square$ specifying movement along axes is executed. This continues until $\square \square$ is issued to cancel a modal call.

Note: The format, functions and argument specification of $\square 65$ are identical with that of the $\square 65$ (non-modal call). ( $\square$ efer to the introduction of $\square 65$ for detailed description).
$\square$ odal call nesting: $\square$ odal calls can be nested $b \square$ specif ing another $\square 66$ code during
a modal call.
Explanation: $\square$ In the specified $\square \square$ bloc $\square$, onl $\square$ argument is passed, and macro modal call $\square$ ill not be executed.
$\square \square$ acro modal call can onl $\square$ be executed in the bloc $\lceil$ s $\square$ ith $\square \square \square, \square \square \square, \square \square \square$, and $\square \square$
$\square \square$ o macro program can be called in a bloc $\square \square$ hich contains a code such as miscellaneous function that does not involve movement along an axis.
4. $\square 5$ and $\square \square$ should not be specified at the same time.
5. $\square$ ultiple macro programs cannot be called in $\square \square$ bloc $\square$
$\square \square$ s $\square$ ith $\square \square 5, \square \square$ should be specified prior to arguments and $\square$.

## - Sample program

> G65 call (bolt hole circle)
$\square$ reate a macro program for machining holes on a circle. $\square$ he radius is I start angle is $\square$ holes interval is $\square$, holes number is $\square \square$ the center of the circle is $\pi, \square \square \square$ ommands can be specified in either the absolute or incremental mode. $\square 0$ drill in the cloc $\square$ ise direction, specif $\square$ a negative value for $\square$.

Format: $\square \square 5 \square \square \square \square \square \square \square \square \square \square \mathrm{li} \square \mathrm{a} \square \mathrm{b} \square \mathrm{h} \square$
$\square: \square$ coordinate of center point absolute or incremental $\square \# \square 4 \square$
$\square: \square$ coordinate of center point absolute or incremental $\square$ \# $5 \square$
$\square: \square$ ole depth (\#ロロ)
$\square$ : $\square$ oordinates of an rapid approaching point (\# $\square \square)$
$\square: \square$ utting feedrate (\#■)
I: ■ircle radius (\#4)
$\square$ : Drilling start angle (\# $\square$ )
$\square$ : Incremental angle cloc $\square$ ise $\square$ hen negative value is specified $\square$ \# $\square$
$\square$ : $\square$ umber of holes (\#■)
Macro call :
ㄴำ

$\square \square \square$

Macro program (the called program):
$\square \square \square \square$
\# $\square$ \#4 $\square \square \square \square \square \square \square \square \square \square \square \square \square . . \square$ tores $\square$ codes of $\square \square$ group

\# $4 \square$ \#5 $\square \square$ \# $\square \square \square \square \square \square$ alculates the $\square$ coordinate of the center point
\# $5 \square$ \#5 $\square \square$ \# $5 \square \square \square \square \square \square$ alculates the $\square$ coordinate of the center point
$\square \square \mathrm{W} \square \square \square \# \square \square \square \square \square \square \square \square \square \square$ ntil the number of remaining holes reaches $\square$
\#5 $\ddagger$ \# $4\lceil \# 4 \square \square \square \# \square ा \square \square \square \square \square \square \square . \square$ alculates the hole position on $\square$ axis

 \# $\square$ \# $\square$ \# $\square \square \square \square \square \square \square \square \square \square \square \square \square \square$ pdates the angles
 $\square \square \mathrm{D} \square$
$\square \# \square \square \square \square \square \square \square \square \square \square \square \square \square \square \square$ eturns the $\square$ codes to the original state.
$\square \square \square$
$\square$ rgumen $\square$ meaning $\square:$ \# $\square$ store $\square$ codes of $\square \square$ group
\#5 $\square$ coordinate of the next hole to drill
$\# \square \square$ coordinate of the next hole to drill
> G66 modal call
Sho $\square \mathbf{n}$ a $\square$ ollo $\square \square \square$ machine $\square$ hole $\square h \square \mathrm{~h} \square, \mathrm{~h} \square \square$

$\square$ all ormat: $\square \square \square \square \square \square \square \square \mathrm{a} \square \mathrm{b} \square \mathrm{c} \square \quad$ (the argument in this example is assumed )

## Macro program:

$\square \square \square ;$

## 5. -ariables

$\square$ n ordinar $\square$ machining program specifies a $\square$ code and the travel distance directl $\square \square$ ith a numeric value, for example, $\square \square \square$ and $\square \square \square \square . \square$ With a custom macro program, numerical value can be specified directl $\square$ or using variables, for example, $\square \# \square \square \square \square \square \square \square$. When variables are used, the variable value can be changed $\mathrm{b} \square$ programs or using operation on the $\square \mathrm{DI}$ panel.

- $\square$ epre $\sqsubset$ entation and $\mathbf{u}$ ing method $\square$ o ariable $\square$

Differ from argument data $\square$ variables are considered as the carrier of data, for example, \#■, $\# \square \square \square$ are variables $\square \square \square \square \square \square \square \square \square$ are arguments. Data of arguments $\square \square \square \square \square \square \square$ should be transferred to variable \# $\square$ and \#■. When using or programming macro programs, numerical value can be specified directl $\square$ such as $\square \square \square, \square \square \square \square$ or using variables such as $\square \# \square \square \square \# \square \square$ When variables are used, the variable value can be changed $\mathrm{b} \square$ programs or using operation on the panel.
$\square$ he address value of a macro bod $\square$ can be specified $b \square$ variables. he variable value can be set $\mathrm{b} \square$ the main program or be assigned the calculated value $\square$ hen executing the macro bod $\square \square$ ultiple variables can be identified $\mathrm{b} \square$ numbers.
$\square \square \square a r i a b l e ~ r e p r e s e n t a t i o n ~$
$\square$ number sign \# follo $\square$ ed $\mathrm{b} \square$ a variable number is sho $\square \mathrm{n}$ as follo $\square \mathrm{s} \square$

Tull mission of decimal point
When a variable value is defined in a program, the decimal point can be omitted. $\square o r$ example $\square$ hen defining \#\#

$\square$ o reference the value of a variable in a program, specif $\square$ a ord address follo $\square \mathrm{ed} \mathrm{b} \square$ the variable number. $\square$ program $\square$ ith an expression $\square$ address $\sqcap i$ or $\square$ address $\square \#$ indicates that the variable value or negative value is used as address value.

$\square \# \square \square \square \square$ hen \# $\square \square \square \square$, it is e uals to $\square \square$

## 4. $\square$ eplace variable numbers $\square$ ith variables

When replace variable numbers $\square$ ith variables, \# $\square \square \square \square$ rather than \#\# $\square \square \square$ is used, the $\square$ follo $\square$ ed \# means the replacement. $\sqsubset$ or example $\square$ hen \# $\square \square \square \square \square$, \# $\square 5 \square 5 \square \square$,

$$
\begin{aligned}
& \square \# \square \square \text { and } \square 5 \square \text { are e } \subset \text { ual. i.e. } \square \# \square \square \square \rightarrow \square \# \square \square \square, \square \square 5 \rightarrow \square 5 \square \square \\
& \square \# \square \square \text { and } \square 5 \square \text { are e } \subset \text { ual. }
\end{aligned}
$$

$\square$ ote: Program number o $\square$ e uence number $\square$ and optional bloc $\square \square$ ip number $\mathbb{C}$ cannot be ollo $\square$ ed $\square$ ith ariable $\square$. For example $\square \square \square$, \#■, $\square \square$.

## 5．$\square$ ocal Variable

$\square$ ocal variables are the variables internall $\square$ defined in a program．$\square$ he $\square$ are effective onl $\square \square$ ithin the program，i．e．，it is onl $\square$ can be used $\square$ ithin the program．
$\square$ local variable \＃that calls macro programs at a certain moment is different from the \＃$\square$ at another moment． $\mathbb{W}$ o matter the macro programs are identical or not $\square$ herefore， ．hen macro program $\square$ is called from macro program $\square$ ，liזe nesting，the local variables used in macro $\square \square$ ill not be misused in macro $\square$ ，and $\square$ ill not disable the value in macro $\square$ ．
$\square$ suall $\square$, the local variables are used to accept the value passed from argument. $\square$ lease refer to $\square$ rgument $\square$ pecification $\square$ for the relationship bet $\square$ een arguments and addresses. $\square \mathbf{a} \square$ attention that, the initial state of local variable is $\square$ ull, before the local variable is defined assigned $\square$

## - $\quad u$ tom macro program ne $\sqsubset$ ting and local $\sqsubset$ ariable

When calling a macro program, its nesting level increases $b \square$ one, and correspondingl$\square$, the level of local variable increases $\mathrm{b} \square$ one as $\square$ ell.
$\square$ he relationship bet $\square$ een macro program call and local variable is sho $\square \mathrm{n}$ as follo $\square \mathrm{s} \square$

## - Explanation

$\square$ \# $\square \sim \square \square$ local variables $\square$ level $\sqsubset$ are provided in the main program.
$\square$ When a macro program $\mathbb{l}$ level $\sqsubset$ is called $\mathrm{b} \square \square \square 5$, the local variable $\square$ level $\square$ is stored, and local variables \# $\square \# \square \square$ of the ne $\square$ macro program is prepared. $\square$ he argument replacement is possible the same as (3)
3. Each time a macro program (2, 3, 4 levels) are called, local variables (1, 2,3 levels) in each group are stored, and new local variables (2,3,4, levels) are prepared.
4. When M99 (return from macro programs) is commanded, the local variables ( $0,1,2,3$ levels) stored in (2), (3) are recovered in the state as they are stored.

### 5.2.3 Common Variable

Common variable is the global variable defined within the system. It can be used in any program. That is to say $\# \square \square \square$ sed in a macro program is the same as the one $\square$ sed in another macro program. Therefore $\square$ the arithmetic operation res It of common variable \# $\square \square$ in a program can be $\square$ sed in another program.

In the system, there is no special regulation for using common variables. \#100~\#199 is the variable group without power-off memory function; \#500~\#999 is the variable group with power off memory function, i.e. data are stored after power-off.

## 5.2.

$\square y s t e m$ variables are used to read and write $\mathrm{C} \square \mathrm{C}$ internal data, such as tool length compensation value, tool nose radius compensation value. $\square$ ome system variables can only be read. $\square y s t e m$ variables are the basis of automatic control and general-purpose machining program development.

- nera Thal The macro variable corresponding to interface signal is the e change signal between $\square \subset$ and custom macro program.

| Variable $\square$. | $\square \square \mathbf{n}$ ion |

### 5.3.1 Tranditional Format

If traditional G65 H format is used for programming, only limited operations and jump command can be specified by it. The currently used H operation needs at most 3 operands, so the corresponding operation can be completed when the needed variables (or constants) are obtained in a block.

## - General format

## 65 Hm P\#i Q\#j R\#k ;

$\mathrm{m}: ~ 01 \sim 99$ means operation command or jump command function
\#i: the name of variable that stored the operation result
\#j: operand 1 ; it can be constant.
\＃k：operand $\sqsubset$ ；it can be constant．
eaning：\＃i $\square$ \＃○ \＃k
$\square$ perational sign，designated by Hm
（ $\square$［ample）G65 Hm P\＃100 $\square \# 101 \quad \square \# 10 \square \square \# 100 \square \# 101 \circ \# 10 \square$ ；
G65 Hm $\square \# 100$ P\＃101 $\square 15 \quad \square \square$ \＃101 $\square 15 \circ$ \＃100 ；

G65 Hm $\square \# 100 \quad \square 100$ P\＃10 $\square$ \＃10 $\square \# 100 \circ-100$ ；

－$\quad$ planations
1 Angular unit
The angular units of function $\square I N \square C \square \square \square A \square I N \square A C \square \square \square T A N$ and ATAN are degree $\square \square$ or example $\square 030$＇means 90.5 degree．

2，ARCSIN \＃i＝ASIN［\＃j］
i．the solution ranges are as indicated below when the NAT bit of parameter No． 015 is set to $0: 270^{\circ} \sim 90^{\circ}$ when the NAT bit of parameter No． 015 is set to $1:-90^{\circ} \sim 90^{\circ}$
ii．when the \＃j is beyond the range of -1 to $1, \mathrm{P} / \mathrm{S}$ alarm is issued．
iii．a constant can be used instead of the \＃j variable．

## 3，ARCCOS \＃i＝ACOS［\＃j］

i．the solution ranges from $180^{\circ} \sim 0^{\circ}$
ii．when the \＃j is beyond the range of -1 to $1, \mathrm{P} / \mathrm{S}$ alarm is issued．
iii．a constant can be used instead of the \＃j variable．

## 4，ARCTAN \＃i＝ATAN［\＃j］／［\＃k］

Specify the lengths of two sides and separate them by a slash／．
The solution ranges are as follows：
When the NAT bit of parameter No． 015 is set to $0: 0^{\circ} \sim 360^{\circ}$
［Example］when \＃1＝ATAN［－1］／［－1］is specified，$\quad \# 1=225^{\circ}$

When the NAT bit of parameter No． 015 is set to 1：$-180^{\circ} \sim 180^{\circ}$
［Example］when \＃1＝ATAN［－1］／［－1］is specified，\＃1＝－135

ii. A constant can be used instead of the \# j variable.
5. Natural logarithm \#i= $N[\# j]$
i. Note that the relative error may be greater than $10^{-8}$.
ii. When the antilogarithm \#j is cero or smaller, P/S alarm is issued.
iii . A constant can be used instead of the \#j variable.
6. Exponential function \#i=E $\square \mathrm{P}[\# \mathrm{j}]$
i. Note that the relative error may be greater than $10^{-8}$.
ii. When the result of the operation exceeds $3.65 \square 10^{47} \square j$ is about $110 \square$, an overflow occurs and P/S alarm is issued.
iii. A constant can be used instead of the \# j variable.

7, $\mathrm{RO} \square \mathrm{N} \square$ function
When the $\mathrm{RO} \square \mathrm{N} \square$ function is included in an arithmetic or logic operation command, $\square \square$ statement, or $\mathrm{W} \square I \mathrm{E}$ statement, the $\mathrm{RO} \square \mathrm{N} \square$ function rounds off at the first decimal place.

## 

When \#1=RO $\square \square \# 2]$ is executed where \#2=1.2345 the value of variable \#1 is 1.0 .
When the $\mathrm{RO} \square \mathrm{N} \square$ function is used in NC statement address, the RO $\square \mathrm{N} \square$ function rounds off the specified value according to the least input increment of the address.

## 8. Rounding up and down to an integer

With CNC, when the absolute value of the integer produced by an operation on a number is greater than the absolute value of the original number, such an operation is referred to as rounding up to an integer. Conversely, when the absolute value of the integer produced by an operation on a number is less than the absolute value of the original number, such an operation is referred to as rounding down to an integer. $\square \mathrm{e}$ particular careful when handling negative numbers.

Suppose that \#1=1.2, \#2=-1.2
When \#3 $=\square \mathrm{P}[\# 1]$ is executed, 2.0 is assigned to \#3.
When \#3 $=\square \square[\# 1]$ is executed, 1.0 is assigned to \#3.
When \#3 $=\square \square \mathrm{P}[\# 2]$ is executed, -2.0 is assigned to \#3.
When \#3= $\square \square[\# 2]$ is executed, -1.0 is assigned to \#3.

## 

1. Uunction
2. Operation such as multiplication and division ( $\square /$ /, AN $\square$ )
3. Operation such as addition and subtraction ( $\square,-$, OR, $\square \mathrm{OR}$ )

①, (2) and 3 indicate the order of operations.

## पा

$\square$ rackets are used to change the order of operations. $\square$ rackets can be used to multinesting.
Note that the s uare bracket [, ] is used to enclose an expression the round bracket (, ) is used in comments. When the priority is not defined, it is advised to use s uare bracket to enclose.

## $5.4 \square$ ranch and Repetition

In a program, the flow of control can be changed using the $\square$ OTO statement and I $\square$ statement. Three types of branch and repetition operations are used:

1. $\square$ OTO statement unconditional branch $\square$
2. $I \square$ statement Conditional branch: $I \square \square \mathrm{~T} \square \mathrm{EN} \square \square$
3. $\mathrm{W} \square I E$ statement repetition $\mathrm{W} \square \mathrm{E} \square \square$

## $\square$ 네

$\square \mathrm{o}$ to the block with se $\sqsubset$ uence number n . when a se .uence number out the range of 1~99999 is specified, an alarm is raised. A se $\quad$ uence number can also be specified using an expression.

पा पा पा: $\square$ OTO 1; $\square$ OTO \#101;

## ㅁㅔㅔ

Specify a conditional expression after I $\square$.

If the specified conditional expression is satisfied, a branch to se $\quad$ uence number n occurs. If the specified condition is not satisfied, the next block is executed.

$\square \square \square \square \square \square!\mid \square$ [conditional expression] T $\square E N \square$ macro statement $\square$;

If the specified conditional expression is satisfied, a predetermined macro statement is executed. Only a single macro statement is executed.

## 밈

$1 \square[\# 1 \mathrm{E} \square$ \#2] T $\square E N$ \#3=0;
If the value of \#1 and \#2 are the same, 0 is assigned to \#3 if not, no execution will be performed.

##

```

Specify a conditional expression after W $\square$ IE. While the specified condition is satisfied, the program from $\square \mathrm{O}$ to $\mathrm{EN} \square$ is executed. If not, program execution proceeds to the block after EN $\square$.
$\square \square \square \square \square \square:$

$\square \square \square \square \square \square$ While the specified condition is fulfilled, the program from $\square \mathrm{O}$ to $\mathrm{EN} \square$ after $\mathrm{W} \square I E$ is executed. If the specified condition is not fulfilled, program execution proceeds to the block after $\mathrm{EN} \square$. The same format as the $I \square$ statement applies. A number after $\square \mathrm{O}$ and a number after $\mathrm{EN} \square$ are identification numbers for specifying the range of execution. The number 1,2 , and 3 can be used. When a number other than 1,2 , and 3 is used, $P / S$ alarm occurs.
$\square \square \square \square \square T$ The identification number $\square$ to $3 \square$ in a $\square \mathrm{O}$, $\mathrm{EN} \square$ loop can be used as many times as desired. Note, however, when a program includes crossing repetition loops overlapped $\square \mathrm{O}$ ranges $\square$ P/S alarm occurs.

| 1. The identification numbers ( 1 to 3 ) can be used as many times as required. <br> 2. DO ranges cannot overlap. $\left[\begin{array}{l} \text { WHILE }[\ldots] \text { DO } 1 ; \\ \hline \text { Processing } \\ \text { WHILE }[\ldots] \text { DO } 2 ; \\ \vdots \\ \text { END } 1 ; \\ \hline \text { Processing } \\ \text { END } 2 ; \end{array}\right.$ | 3. DO loops can be nested to a maximum depth of three levels. <br> 4. Control can be transferred to the outside of a loop. <br> 5. Branches cannot be made to a location within a loop. |
| :---: | :---: |

## $5.5 \square$ acro Statement and NC statement

The following blocks are referred to as macro statements:

- $\quad \square$ locks containing arithmetic or logic operation $\# \square$
- $\square$ locks containing a controlling statement such as $\square \mathrm{OTO}, \square \mathrm{O}, \mathrm{EN} \square \square \square$
- $\square$ locks containing a macro call command. such as $\square 65, \square 66 \square$
$\square$ locks other than macro statements are referred to as NC statement.

## ㄷㅔㅔ

Custom macro program are similar to subprogram. They can be edited, registered and used in the same way as subprogram. $\square 98$ can call a custom macro program, but cannot pass arguments.
$\square$ sually, the macro program is provided by tool builders, but it can also be programmed by customers. It is not necessary for the customers to remermber all related commands in macro programs besides codes that call macro programs.

## 

- $\quad$.

In cutter compensation C mode $\mathbb{1} 41, \square 42 \square$, in order to calculate the transmission point, NC prereads the next block. The processing way is not the same as general NC statement.

When a macro statement is executed as a single block, it is the block that does not involve
 such block involves 0 distance of movement .
> ump ( $\square \mathrm{OTO}, \square \mathrm{O}, \mathrm{EN} \square$ )
In cutter compensation C mode, when jump command ( $\square \mathrm{OTO}, \square \mathrm{O}, \mathrm{EN} \square$ ) is specified, $\mathrm{P} / \mathrm{S}$ alarm occurs.
> When the move command adopts variables
In cutter compensation C, when the move command such as $\square 01$, $\square 101 \square$ adopts variables, P/S alarm occurs. Cecause cutter compensation C mode is block preread mode, the end point of the next block is essential for calculating the current transmission point position. Specifying $\square$ \#101 an unknown data does not enable a correct calculation of the current transmission point.

## 

In $\square \square$ I mode, macro programs can be specified, but macro program call cannot be executed.

## 

A $\downarrow$ appearing in the middle of an $\llbracket$ expression $\square$ enclosed in brackets [] on the right-hand side of an arithmetic expression $\square$ is regarded as a division operator $\square$ it is not regarded as the specified for an optional block skip code.

## - $\quad$ पापा

A reset operation clears any called states of custom macro programs and subprograms, and cursor returns to the first block of the main program.

## 

### 6.1 Application for Cutter Radius Compensation

$\square$ enerally, the parts machining process is programmed according to parts drawing in one point on a tool. As for the tool used actually, because of the processing or other re $\sqsubset u i r e m e n t$, the tool is not an ideal point, but an arc only. The position offset exists between actual cutting point and ideal point when the cutting feed is performed. It may cause over cut or undercut, so the part accuracy will be affected. So, the cutter radius compensation can be used to improve the part accuracy in machining.

The path of part figure can be shifted by a cutter radius, which this method is called $\square$ type tool compensation this is a simply method but the movement path of next block can be processed only after a block is performed, so the phenomenon as over cutting will be generated at the intersection point of two blocks.

In order to settle the above issues and eliminate the error, the Tool compensation C should be setup. When a block is read in, the tool compensation C is not performed immediately but the next block is read in again. Corresponding movement path is calculated according to the point of intersection of two blocks conjunction vector The tool compensation C performs more accurate compensation in figure because two blocks are read for processing in advance. See the $\square i g .6-1$

-ig.6-1 C type cutter radius compensation

## 

The radius value of each tool should be set before tool compensation C is applied. Tool radius compensation value is set in the O SET page table 6-1, this page contains tool geometric radius and tool radius wear. There into, $\square$ is the tool compensation value, when the bit 1 of bit parameter No. 003 is 1 , the $\square$ is compensation value input by diameter. If the bit 1 of bit parameter No. 003 is 0 , the $\square$ is compensation value input by radius. The following explanations are all indicated in radius compensation value if not especially pointed out.
Table 6-1 $\square$ isplay page for CNC cutter radius compensation value

| $\square 17$ | Offset plane selection command $\mathbb{\square} \square$ plane $\square$ | See the ■ig.6-2 |
| $\square 18$ | Offset plane selection command $\square \square$ plane $\square$ |  |
| $\square 19$ | Offset plane selection command $\mathbb{\square} \square$ plane $\square$ |  |
| $\square 40$ | Cutter radius compensation cancellation |  |
| $\square 41$ | Cutter radius compensation left along advancing direction |  |
| $\square 42$ | Cutter radius compensation right along advancing direction |  |

## 

Tool compensation direction is determined according to the relative position of tool with work piece, when the cutter radius compensation is applied. See the $\square$ ig.6-2.

- In initial status CNC is in cutter radius compensation cancellation mode. CNC sets cutter radius compensation offset mode when the $\square 41$ or $\square 42$ command is executed. At the beginning of the compensation, the CNC reads two blocks in advance, the next block is stored in the cutter radius compensation buffer memory when a block is performed. When in Single mode, two blocks are read, after the end point of the $1^{\text {st }}$ block is performed, it is stopped. Two blocks are read in advance in successive performance. So, there are a block being performed and two blocks behind it in CNC.
- Neither setup nor cancellation of the Tool compensation C can be performed in the $\square \square I$ mode.
- The cutter radius compensation value can not be a negative, normally, the wearing value is negative negative value indicates for wearing $\square$
- Instead of $\square 02$ or $\square 03$, the setting or cancellation of cutter radius compensation can be commanded only by using $\square 00$ or $\square 01$, or the alarm occurs.
- CNC will cancel Tool compensation C mode when you press RESET key.
- Corresponding offset should be specified while the $\square 40$, $\square 41$ or $\square 42$ is specified in the block, or the alarm occurs.
- When cutter radius compensation is employed in main program and subprogram, the CNC should cancel compensation mode before calling or exiting sub-program namely, before $\square 98$ or $\square 99$ is performed, or the alarm occurs.
Cancel the compensation mode temporarily when $\square 54-59, \square 28-31$ and canned cycle command are executed. Restore the cutter radius compensation mode when the above commands are finished.

## ㅁㅔㅔ

The parts are machined in the coordinate system in $\square$ ig. 6-3. The tool compensation number $\square 07$ is employed, tool geometric radius is 2 mm and the tool radius wearing is 0 .

Perform tool setting in the mode of offset cancellation, after finishing the tool setting, and set the tool radius $\square$ in $\mathrm{O} \square$ SET page.
Table.4-2

| NO. | $\square$ eometric $\square \square$ | Wearing $\square \square$ | $\square$ eometric $\square \square$ | Wearing $\square \square$ |

Cancels the offset mode, the tool is returned to the start position $\mathbb{T} 0, \square 0 \square$

### 6.2 Offset Path Explanation for Cutter Radius Compensation

## ㄴㅔㅔ

Inner side $\square$ and outer side $\sqsubset$ will be employed in the following explanations. When an angle of intersection created by tool paths specified by move commands for two blocks is over or e $\sqsubset u a l$ to $180^{\circ}$, it is referred to as inner side When the angle is between $0^{\circ}$ and $180^{\circ}$, it is referred to as outer side. .

## 

There are 3 steps should be performed for cutter radius compensation: establishment, performing and cancellation.

The tool movement performed from offset cancellation mode to $\square 41$ or $\square 42$ command establishment is called tool compensation establishment also called start-up $\square$

### 6.2.5 Interference check

Tool over cutting is called "interference". The interference check function can check tool over cutting in advance. This interference check is performed even if the over cutting does not occur. However, all interference can not be checked by this function.

## (1) Conditions for the interference

1) The direction of the tool path is different from that of the programmed path. ( 90 degrees to 270 degrees between these paths)
2) In addition to the condition above, the angle between the start point and end point of the tool center path is quite different from that between the start point and end point of the programmed path in circular machining (more than 180 degrees).

## Example: Linear machining

Fig.6-1 $\square \square$ achining interference (1)

Fig.6-1 b $\square$ achining interference ( $\square$ )

Fig.6- $\square \square$ ceptional case (1) treated as interference

There is no interference actually, but program direction in block $\square$ is opposite to the cutter radius compensation path. The cutter stops, and the alarm occurs.
2) The groove depth less than compensation value

Fig.6- $\square \square$ ceptional case ( $\square$ ) treated as interference

There is no interference actually, but program direction in block $\square$ is opposite to the cutter radius compensation path. The cutter stops, and the alarm occurs.

### 6.2.6 Command of compensation ector cancel temporaril $\square$

If the following commands G92, G28, G29, coordinate command selection G■ロG■9 and canned cycle are specified in compensation mode, the compensation vector is temporarily cancelled and then automatically restored after these commands are e「ecuted. Now, the temporary compensation vector cancellation is different to the compensation cancellation mode, tool is moved to the specified point by compensation vector cancellation from the intersection. $\square$ nd the tool moves to the intersection directly when the compensation mode restores.

- Coordinate satem setting command $\square 2$ and coordinate satem selection command $\square 5 \square \square \square$

Fig.6- $\square \quad$ Temporar $\square$ compensation $\lceil$ ector $\mathrm{b} \square \mathrm{G} \square$
$\square$ ote: $\square$ is indicated as the point stopped for $t \square$ ice in $\square$ ingle $\square$ lock mode.

- $\square$ utomatic return to the reference point $\quad \square 2$

If G28 is specified in compensation mode, the compensation will be cancelled at an intermediate position. The compensation mode is automatically restored after the reference point is returned.

$\square$ ig. $\square 2 \square$ Temporarily cancel compensation vector by G28

## - Canned crcle

If the canned cycle command is specified in compensation mode, the compensation will be temporarily cancelled in the canned cycle operation 1 . The compensation mode is automatically restored after the canned cycle is terminated.

### 6.2. Exceptional case

## - $\square$ hen the inner corner machining is less than tool radius

hen the inner corner machining is less than tool radius, the inner offset of a tool will cause over cut. The tool stops and alarm occurs after moving at the beginning or at the corner in previous block. $\square u t$ if the switch of "Single block" is $\square \mathrm{N}$, the tool will be stopped at the end of the previous block.

## - $\square$ hen a groo e less than the tool diameter is machined

$\square$ hen the tool center moves opposite to the direction of programmed path, the over cutting will be generated by the cutter radius compensation. Tool stops and alarm appears after moving at the beginning of previous block or at the corner.

## - $\square$ hen a step less than the tool radius is machined

hen a program contains a step which is an arc and less than tool radius, tool center path may form a opposite movement direction to the programmed path. So the first vector is ignored and it moves to the end of the second vector along a straight line. The program will be stopped for Single block mode, the cycle continues if it is not single block mode. The compensation will be e匹ecuted correctly and no alarm will be generated if the step is a straight line. ( $\square$ ut the uncut part is reserved.)

## - $\square$ hen the su $\square$ program is contained in $\square$ code

CNC should be in compensation cancellation mode before calling the sub program (namely, before the G98 is performed). $\square$ ffset can be applied after entering the subprogram, but the compensation cancellation should be applied before returning to the main program (before M99), or the alarm occurs.

## - $\square$ hen compensation $\sqsubset$ alue is changed

(a) Usually, the compensation value is changed when the tool change is performed in compensation cancellation mode. If the compensation value is changed in compensation mode, the
new one is ineffective which is effective till the program is e $\sqsubset$ ecuted again.
(b) If different compensation values are commanded in different blocks of a program, different compensation value will be compensated to the corresponding block. पut if it is an arc, the alarm will be generated. $\square$ or details, refer to the following e $\llbracket$ planation.
(c) about "arc data error in C type cutter radius compensation".

## - $\square$ hen the end point for the programming arc is not on the arc

$\square$ hen the end point for the programming arc is not on the arc, the tool stops and the alarm information shows "end point is not on the arc".

Two same points in the starting is shown an e $\lceil a m p l e \square$

N0 G90 G00 0
N1 G91 G1 G $\square \square 0 \square 0$ D1 $\square 800 \square$ without moving
N2 G90 $\square 0 \square 0$
$\mathrm{N} \square \mathrm{D}_{0}$

The abovementioned program may occur the "two same points" when starting, and the compensation may not perform. The transit point $\square 1$ between N0 and N1 and the transit point $\square 2$ between N1 and N2 are shared a same point.

N0 G90 G00 0
N1 G1 G $\square 1 \square 0 \square 0$ D1 $\square 800$
N2 G91 $\square 0 \square 0 \square$ without moving
$\mathrm{N} \square \mathrm{O}$

The "last two same points" may occur when starting at the last program, in the case of the compensation has been performed. The section without moving which is regarded as the movement
appro imates to the ero，so it is necessary to maintain the compensation amount．The transit point between N1 and N2 is $\square 1$ ，and the transit point between N2 and $\mathrm{N} \square$ is $\square 2$ ，$\square 1$ and $\square 2$ are shared a same point．

In the same way，in the compensation mode，if the＂two same points＂may occur，the compensation value will be maintained in the retraction mode，the similar start mode is divided into ＂the previous two same points＂and＂the last two same points＂
－he alarm and corresponding explanation of Circular arc data error in cutter compensation C $\square$
（a）$\square$ he example of this alarm ma occur in a circle
$\square$ orgram e「ample：N0 G90 G00 $\square 0 \square 0 \square 0$

程序路径：$\square$ rogrammed path
刀具中心路径：Tool center path

The transit point between straight line N1 and circular arc N2 is $\square 1$ ，the transit point between circular N2 and straight line $N \square$ is $\square 2$ ，and the compensation radius is $r$ ，in this case，the circular after tool compensation is more than $\square 0$ ．

$\square$ fter a block（N9 G91 G0 $\square \square 0$ ）（without moving）is inserted between N1 and N2 in the above mentioned program，the＂circular data error in cutter compensation C＂may alarm．
$\square$ ecause the point after N9 inserted which is equal to the one of N1，namely，they are regarded as＂two same points＂．The transit point $\square 1$ is performed treating the＂two same points＂，the position of $\square 1$ is obviously differ from the above one which does not insert the N9 block．So the cut circular arc path by this transit pont is absolutely differing from the path to be machined，so the alamr is then generated＂circular arc data error in cutter compensation C＂
（ $\square$ he example for a non circle ma occur：

The $\square 1$ and $\square 2$ are the transit point of tool compensation as the left figure shown, wherein the " $r$ " is compensation radius. This is a normal treatment mode for the straight line to circular arc.

The alarm may occur in terms of the following program
N0 G90 G00 $\square 0 \square 0 \square 0$
N1 G01 G $\square \square 0 \square 0$ D1 $\square 800 \square$ without moving, originally start
N2 GO2 $\square 0 \square 2 \square$
$\square$ ecause the N1 block does not a movement, namaly, it equals to the "two same points". The transit points $\square 1$ and $\square 2$ are performed based on the treatment of two same points (The path of two same points), so the circular arc path cut by this transit point obviously differs from the actual path to be machined, in this case, the "circular arc data error in cutter compensation C" may alarm.
(c) In the calculation of arc cutter compensation $\mathbf{C} \square$ this alarm ma issue if the compensation radius $\square$ is modified.

$\square$ rogram e $\square$ ample N0 G90 G00 $\square 0 \square 0 \square 2 \square$
N1 G01 G $\square 1 \square 0 \square 0$ D1 $\square 800$
N2 G02 $\square 0 \square 2 \square$
$\mathrm{N} \square \mathrm{G} 02 \square 100 \square 2 \square$
The left figure is shown the programmed path and the tool center path.
If the compensation radius D is changed in $\mathrm{N} \square$, for e $\sqsubset$ ample, the D 2 is speicified in $\mathrm{N} \square$ block (the value of D 2 is not equal to the one of D 1 ), in this case, it is similar as (b), an alarm of the "circular arc data error in cutter compensation C" may occur.

## VOLUME II OPERATION

## CHAPTER1 OPERATION MODE AND DISPLAY

This GSK980MDa system employs an aluminum alloy solid operator panel, which exterior is as follows.

### 1.1 Panel Division

This GSK980MDa adopts an integrated panel, which division is as follows:

1.1.1 State indication

|  | machine zero return finish indicator | $\bigcirc$ | Rapid indicator |
| :---: | :---: | :---: | :---: |
|  | Single block indicator |  | Block Skip indicator |
|  | Machine Lock indicator |  | MST Lock indicator |
|  | Dry Run indicator |  |  |

### 1.1.2 Edit keypad

| Key |  |  |  | Name | Function |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | $\begin{gathered} \text { RESET } \\ \text { key } \end{gathered}$ | For CNC reset, feed, output stop etc. |
| (0) | $\mathbb{N}$ | 写 | $\mathrm{P}^{1}$ | Address <br> key | Address input |
| X | ${ }^{\text {Y }}$ |  | $\square_{W}^{\square}$ |  |  |
| $\mapsto$ | $\mathrm{F}_{\text {e }}$ | $\stackrel{F}{\text { P }}_{\text {v }}$ | $\square \square_{L}$ |  |  |
| $\mathbb{1}_{\mathbb{A}}$ $\ddots_{\mathrm{a}}$ $\mathbb{K}_{\mathrm{a}}$ <br> $\mathbb{M}_{\mathbb{I}}$ $\mathbb{S}_{\mathbb{1}}$ $\mathbb{T}_{=}$ |  |  |  |  |  |
|  |  |  |  | Double address key, switching between two sides by pressing repeatedly |  |
| - + |  |  |  |  | Sign key | Double address key, switching between two characters by pressing repeatedly |

Chapter 1 Operation Mode and Display

### 1.1.3 Menu display

| Menu key | Remark |
| :---: | :---: |
| POSmoN | To enter position interface. There are RELATIVE POS, ABSOLUTE POS, <br> INTEGRATED POS, POS\&PRG pages in this interface. |

| PROSPAM | To enter program interface. There are PRG CONTENT, PRG STATE, PRG LIST, PRG PREVIEW,4 pages in this interface. |
| :---: | :---: |
| Offset | To enter TOOL OFFSET interface. There are TOOL OFFSET, MARRO variables and Tool Life Management (modifying Bit0 of state parameter №002). OFFSET interface displays offset values; MARRO for CNC macro variables. |
| SLAPM | To enter alarm interface. There are CNC, PLC ALARM and ALARM Log pages in this interface. |
| SETING | To enter Setting interface. There are SWITCH, PASSWORD SETTING, DATE \&TIME, SETTING (G54~G59) , GRAGH SET and TRACK pages in this interface. |
| PAPM EIER | To enter BIT PARAMETER, DATA PARAMETER, PITCH COMP interfaces (switching between each interface by pressing repeatedly). |
| Duckosis | To enter DIAGNOSIS interface.There are CNC DIAGNOSIS, PLC STATE, PLC VALUE, VERSION MESSAGE interfaces (switching between each interfaces by pressing the key repeatedly). CNC DIAGNOSIS, PLC STATE, PLC VALUE interfaces display CNC internal signal state, PLC addresses, data state message; the VERSION MESSAGE interface displays CNC software, hardware and PLC version No. |

### 1.1.4 Machine panel

The keys function in GSK980MDa machine panel is defined by PLC program (ladder), see their function significance in the machine builder's manual.

The functions of the machine panel keys defined by standard PLC program are as follows:

| Key | Name | Function explanation | Function mode |
| :---: | :---: | :---: | :---: |
|  | Feed Hold key | Dwell commanded by program, MDI | Auto mode, DNC, MDI mode |
| $\begin{aligned} & { }^{\circ} \text { til } \\ & \text { craf stumt } \end{aligned}$ | Cycle Start key | Cycle start commanded by program, MDI | Auto mode, DNC, MDI mode |
|  | Feedrate Override keys | For adjustment of the feedrate | Auto mode, DNC, <br> MDI mode, Edit mode, Machine zero mode, MPG mode, Single Step mode, MANUAL mode |

Chapter 1 Operation Mode and Display

| Key | Name | Function explanation | Function mode |
| :---: | :---: | :---: | :---: |
|  | Rapid override keys | For adjustment of rapid traverse | Auto mode, DNC, <br> MDI mode, Machine zero <br> mode, MANUAL mode |
|  | Spindle override keys | For spindle speed adjustment (spindle analog control valid) | Auto mode, DNC, <br> MDI mode,edit mode, Machine zero mode, MPG mode, Step mode, MANUAL mode |
| ${ }^{\circ}{ }^{\circ} \mathrm{T}_{\mathrm{JOO}}$ | JOG key | For spindle Jog ON/OFF | Machine zero mode, MPG mode, Single Step mode, MANUAL mode, |
| O. | Lubricating key | For machine lubrication ON/OFF | Machine zero mode, MPGmode, Single Step mode,MANUAL mode, |
|  | Cooling key | For coolant ON/OFF | Auto mode, MDI mode,Edit mode, Machine zero mode, MPG mode Step mode, MANUAL mode |
|  | Spindle control keys | Spindle CCW <br> Spindle stop <br> Spindle CW | Machine zero mode, MPGmode, Single Step mode,MANUAL mode, |
| $\begin{gathered} { }^{0} \mathbf{N} \\ \text { RNW } \end{gathered}$ | Rapid traverse key | For rapid traverse /feedrate switching | Auto mode, DNC,MDI mode, Machine zero mode, MANUAL mode, |
|  | Manual feed key | For positive/negative moving of $X, Y, Z$ axis in Manual, Step mode | Machine zero mode, Step mode, MANUAL mode, |

| Key | Name | Function explanation | Function mode |
| :---: | :---: | :---: | :---: |
| (3) |  |  |  |
|  | Handwheel axis selection key | For $\mathrm{X}, \mathrm{Y}, \quad \mathrm{Z}$ axis selection in MPG mode | MPG mode |
|  | MPG/Step increment and Rapid override selection key | Move amount per handwheel scale $0.001 / 0.01 / 0.1 \mathrm{~mm}$ Move amount per step $0.001 / 0.01 / 0.1 \mathrm{~mm}$ | Auto mode, MDI mode, Machine zero mode, MPG mode, Step mode,MANUAL mode, |
| SINGLE | $\begin{aligned} & \text { Single Block } \\ & \text { key } \end{aligned}$ | For switching of block/blocks execution, Single block lamp lights up if Single mode is valid | Auto mode, DNC, MDI mode |
| $\frac{\square}{\square\rangle \text { SKIP }}$ | Block Skip key | For skipping of block headed with"/"sign, if its switch is set for ON, the Block Skip indicator lights up | Auto mode, DNC, MDI mode |
| $\frac{\overline{\text { BGI }}}{\substack{\text { MaHINE } \\ \text { LOCHK }}}$ | Machine Lock key | If the machine is locked, its lamp lights up, and $\mathrm{X}, \mathrm{Z}$ axis output is invalid. | Auto mode, DNC, <br> MDI mode, Edit mode, Machine zero mode, MPG mode, Step mode, MANUAL mode, |
| $\begin{aligned} & \text { - MST } \\ & \text { LTV } \\ & \text { M.S.T. LOCK } \end{aligned}$ | M.S.T. Lock key | If the miscellaneous function is locked, its lamp lights up and M, S , T function output is invalid. | Auto mode, DNC, MDI mode |
| $\cdot \frac{\Omega}{\text { DRY }}$ | Dry Run key | If dry run is valid, the Dry run lamp lights up. Dry run for program/MDI blocks command | Auto mode, DNC, MDI mode |

| Key | Name | Function explanation | Function mode |
| :--- | :--- | :--- | :--- |
| Edit mode key | To enter Edit mode | Auto mode, DNC, MDI <br> mode, Machine zero mode, <br> MPG mode, Step mode, |  |
| MANUAL mode |  |  |  |

### 1.2 Summary of Operation Mode

There are 7 modes that include Edit, Auto, DNC, MDI, Machine zero, Step/MPG, Manual, modes in this GSK980MDa.

## - Edit mode

In this mode, the operation of part program setting-up, deletion and modification can be performed.

## - Auto mode

In this mode, the program is executed automatically.

## - MDI mode

In this mode, the operation of parameter input, command blocks input and execution can be performed.

## - Machine zero mode

In this mode, the operation of $\mathrm{X}, \mathrm{Y}, \mathrm{Z}, 4^{\text {th }}, 5^{\text {th }}$ axis machine zero return can be performed separately.

- MPG / Step mode

In the Step/MPG feed mode, the moving is performed by an increment selected by CNC system.

## - Manual mode

In this mode, the operation of Manual feed, Manual Rapid, feedrate override adjustment, Rapid override adjustment and spindle ON/OFF, cooling ON/OFF, Lubrication ON/OFF, spindle jog, manual tool change can be performed.

- DNC mode

In this mode, the program is run by DNC mode.

### 1.3 Display Interface

There are 7 interfaces for GSK980MDa such as Position, Program etc., and there are multiple pages in each interface. Each interface (page) is separated from the operation mode. See the following figures for the display menu, display interface and page layers:

| Menu key | Display interface | Display page |  |
| :---: | :---: | :---: | :---: |
| Posmon | Position interface |  |  |
|  | Pro. content | PRG CONTENT |  |
|  | Pro. state | PRG STATE |  |
| PROGPAM | Pro.previe <br> w | PRG PREVIEW |  |
|  | Program list | PRG LIST |  |

### 1.3.1 Position interface

Press Posmon to enter Position interface, which has four interfaces such as ABSOLUTE POS,

RELATIVE POS, INTEGRATED POS and POS\&PRG, and they can be viewed by
 or
 key.

## 1) ABSOLUTE POS display interface

The X, Y, Z coordinates displayed are the absolute position of the tool in current workpiece coordinate system, as CNC power on, these coordinates are held on and the workpiece coordinate system is specified by G92.

| ABSOLUTE POS | 00000 N00000 |
| :---: | :---: |
|  | G00 G17 G90 G54   <br> G21 G40 G49 G94 |
| Y 0.000 | F0100 S 00 M30 |
|  | PRG. F: 100 |
| Y | ACT. F: 0 |
|  | FED OVRI: 150\% |
| 7 (7.000 | RAP OVRI: 100\% |
|  | SPI OVRI: 100\% |
|  | PART CNT: 0 |
|  | CUT TIME: 0:00:00 |
| MDI | S0000 T00 H00 |

PRG. F: a rate specified by F code in program
Note: It displays "PRG. F" in Auto, MDI mode; "MAN. F" in Machine zero, Manual mode;"HNDL INC"in MPG mode; "STEP INC"in Step mode.
ACT. F: Actual speed after feedrate override calculated.
FED OVRI: An override that is selected by feedrate override switch.
SPI OVRI: Adjust the spindle rotational speed by altering spindle override.
PART CNT: Part number plus 1 when M30 (or M99 in the main program) is executed
CUT TIME: Time counting starts if Auto run starts, time units are hour, minute and second
The parts counting and the cut time are memorized at power-down and the clearing ways for them are as follows:

S0000: Feedback spindle speed of spindle encoder, and spindle encoder must be fixed to display actual spindle speed.
T01: Current tool No. and tool offset No.

## 2) RELATIVE POS display page

The $\mathrm{X}, \mathrm{Y}, \mathrm{Z}$ axis coordinates displayed are the current position relative to the relative reference point, and they are held on at CNC power on. They can be cleared at any time. If $\mathrm{X}, \mathrm{Y}$, Z axis relative coordinates are cleared, the current position will be the relative reference point. When CNC parameter No. 005 Bit1=1, as the absolute coordinates are set by G92 code, X, Y, Z axis relative coordinates are identical with the set absolute coordinates.

The clearing steps of $\mathrm{X}, \mathrm{Y}, \mathrm{Z}$ axis relative coordinates:

In RELATIVE POS page, press and hold $\square$ key till the " $X$ "in the page blinks, press

CANCE
$\square$
$\square$
$\square$ key till the " $Y$ "in the page blinks, press
In RELATIVE POS page, press and hold虫 $\square$ key to clear Y coordinate;

In RELATIVE POS page, press and hold | $\mathbb{Z}_{i}$ |  |
| :---: | :---: |
|  |  |
| CNNCI |  | key to clear Z coordinate;

The method for $\mathrm{X}, \mathrm{Y}, \mathrm{Z}$ axis relative coordinates divided by 2 :

In RELATIVE POS page, press and hold $\square$ key till the " $X$ "in the page blinks, press

| \% ${ }_{\text {\% }}$ |
| :---: | key, X coordinate will be divided by 2 ;

 key, Y coordinate will be divided by 2;

In RELATIVE POS page, press and hold $\square$ k key till the "Z"in the page blinks, press
 key, $Z$ coordinate will be divided by 2 ;
3) INTEGRATED POS display page

In INTEGRATED POS page, the RELATIVE, ABSOLUTE, MACHINE coordinate, DIST TO GO (only in Auto and MDI mode) are displayed together.

The displayed value of MACHINE coordinate is the current position in the machine coordinate system which is set up according to the machine zero.

DIST TO GO is the difference between the target position of block or MDI and the current position.

The display page is as follows:

| INTEGRATED POS |  |  |  | 000 | N00000 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| (RELATIVE) |  | (ABSOLUTE) |  | G00 G17 G90 G54   <br> G21 G40 G49 G94 G98 |  |
| X | 0.000 | X | 0.000 |  |  |
| Y | 0.000 | Y | 0.000 | F0100 S | M30 |
| Z | 0.000 | Z | 0.000 | PRG. F: | 100 |
|  | NE) |  | TO GO) | ACT. F: |  |
| X | 0.000 | X | 0.000 | RAP OVRI: | 100\% |
| Y | 0.000 | Y | 0.000 | SPI OVRI: | 100\% |
| Z | 0.000 | Z | 0.000 | PART CNT: CIT TIME: | $\begin{array}{r} 0 \\ 0: 00: 00 \end{array}$ |
| MDI |  |  |  | S000 | T00 H00 |

4) POS\&PRG display page

In this page, it displays ABSOLUTE, RELATIVE of the current position (ABSOLUTE, DIST TO GO of current position will be displayed if BITO of bit parameter No. 180 is set to 1 ) and 5 blocks of current program together. During the program execution, the blocks displayed are refreshed dynamically and the cursor is located in the block being executed.

### 1.3.2 Program interface

1) PROGRAM CONTENT page
all blocks will be displayed by pressing
 and
 keys in MDI mode.

| PRG CONTENT | SEG1 | COL:1 | C:/00000. CNC |
| :--- | :--- | :--- | :--- |
| $00000(00000) ;$ |  |  |  |

2) PROGRAM STATE page

key to enter program state interface in program content interface. Current G,M,S,T,F commands and related commands are displayed in program state interface and a single block (MDI) can be executed in this interface.

## 3) PROGRAM PREVIEW page

In program content interface, press
$\square$
PROGPMM
key to enter program preview page. In this page, all part programs are listed. To make it easier for user to select a program, the system displays 5 blocks before the program with cursor at the bottom of the page. User can press EOB directly to select a program and process automatically, or press DEL key to delete the program in this page. It displays the following contents :
(a) Memory capacity: Display the maximum capacity of CNC memory unit.
(b) Used capacity: The space occupied by the saved programs
(c) Program NO.: Display the total number of programs in the CNC (including subprograms)
(d) Size of the program: The size of the program which the cursor is in, unit: byte (B)
(e) Program list: Display numbers of saved programs (arranged by name).

| PRG PREVIEN | 00003 N00000 |
| :---: | :---: |
| 00000000010000200003 | MEM SIZE: 40.0MB |
|  | MEM USED: 100 KB |
|  | PRG AMOT: 4 |
|  | PRG SIZE: 17B |
| 00000 (00000); |  |
| \% |  |
| EDIT | S0000 T00 H00 |

4) FILE LIST page

GSK980MDa supports USB interface, CNC $\rightarrow$ USB and USB $\rightarrow$ CNC mutual transmission operation are provided in this interface. In this page, it is easy to see the file list and file of CNC and USB (when USB is connected). At the same time, opening, duplication and deletion can be done here.

### 1.3.3 Tool offset, macro variable and tool life management interface

$\square$ is a compound key, press $\square$ key once in other page to enter the TOOL OFFSET page, press $\square$ key again to enter the MACRO interface.

1. OFFSET interface

There are 4 tool offset pages in this interface, and 32 offset numbers (No.001~No.032) available for user, which can be shown as the following figure by pressing
 or
 keys.

| TOOL | OFFSET |  |  |  |  | 003 N00 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| NO. | Geo(H) | Wear (H) | Geo(D) | Wear (D) |  | TIVE) |
| 01 | 0.000 | 0.000 | 0.000 | 0.000 | X | 0.000 |
| 92 | 0.000 | 0.000 | 0.000 | 0.000 | Y | 0. 000 |
| 93 | 0.000 | 0.000 | 0.000 | 0.000 | T | 0.00 |
| 94 | 0.000 | 0.000 | 0.000 | 0.000 | 2 | 0.000 |
| 05 | 0.000 | 0.000 | 0.000 | 0.000 |  | LUTE) |
| 96 | 0.000 | 0.000 | 0.000 | 0.000 | X | 0.000 |
| 97 | 0.000 | 0.000 | 0.000 | 0.000 | Y | 0.000 |
| 08 | 0.000 | 0.000 | 0.000 | 0.000 | Z | 0.000 |
| NO. | 001 |  |  |  |  |  |
| EDIT |  |  |  |  | S0000 T00 H00 |  |

## 2. MACRRO interface

There are 25 pages in this interface, which can be shown by pressing
 or
 keys. In Macro page there are 600 (No. $100 \sim$ No. 199 and No. $500 \sim$ No.999) macro variables which can be specified by macro command or set by keypad. Please refer to "macro, chapter 5, program" for related information.

| MACRO |  |  |  | 00003 N00000 |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| NO. | DATA | NO. | DATA | NO. | DATA |
| 100 | Null | 108 | Null | 116 | Null |
| 101 | Null | 109 | Null | 117 | Null |
| 102 | Null | 110 | Null | 118 | Null |
| 103 | Null | 111 | Null | 119 | Null |
| 104 | Null | 112 | Null | 120 | Null |
| 105 | Null | 113 | Null | 121 | Null |
| 106 | Null | 114 | Null | 122 | Null |
| 107 | Null | 115 | Null | 123 | Null |
| NO. 100 |  |  |  |  |  |
| EDIT |  |  |  |  | S0000 T00 H00 |

## 3. Tool life management

Note: The tool change signal TLCH: F064\#0 should be added for PLC when using this function.

Ladder example:

## - Using of tool life management function

Parameter (No.002\#0) is used as the symbol for tool life management function (0-unused, 1 -used); if the function is not used, the relevant tool life management page is not shown.

## - Tool life management display interface

The tool life management is controlled by

## OFFSET

 sub-interface, and it is composed by 2 pages (paging by page keys). Interface is shown by pressingkey repeatedly

## Tool life management display (the $1^{\text {st }}$ page)

The $1^{\text {st }}$ page for tool life management interface displays the life data of the current tool and the tool group list that has been defined. This page is mainly used for monitoring the tool life data by group units. The data monitoring of each tool in a group, group number setting and tool life management data are displayed in the following page.

| T-LIFE MANAG. | 00003 N00000 |  |
| :--- | :--- | ---: |
| Cur. T State: |  |  |
| Tool Group Life Used Mode State |  |  |
| Defi. Group: |  |  |
| - |  |  |
|  |  |  |
|  |  |  |
| MDI |  |  |

i . Display explanation
<Current Tool State>: It displays the life data of the current tool which is being used.
Mode: It displays the counting unit of life data. ( 0 : minute/1: times)
State: It displays the tool status. (0-Unused, 1-Using, 2-Over, 3-Skip)
< Defined Group No. >: It only displays the group numbers which have been defined, and the undefined are not shown. The group number with the backlight means that all the tool life in that group has expired.
ii . Deletion of all defined data

In this page, press
 keys, it may delete all the data which have been defined (including group number, group tool numbers and life values, etc. )

Tool life management interface (the 2nd page)
The $2^{\text {nd }}$ page is used to set and display the life data of a group which are displayed by order $1 \sim 8$.

| T-LIFE MANAG. | 00003 N00000 |  |
| :--- | :--- | ---: |
| Tool Group: 01 |  |  |
| No. Offset Life Used Mode State |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
| Group |  |  |
| MDI |  | S0000 T00 H00 |

There are 3 display types for tool group selection:
i. Directly input the group number in the "Tool Group P"of the $2^{\text {nd }}$ page, it displays the tool life data. If the group does not exist, the number input will be taken as a new group number.The new group number: 05 , and the $1^{\text {st }}$ tool will be defined by system automatically:
ii. Move the cursor to select the group number in the "Defined Group No." of the $1^{\text {st }}$ page, and it displays the group content as turning to the $2^{\text {nd }}$ page.
iii. As the current group number content is displayed in the $2^{\text {nd }}$ page, it continues to display the following group number content by turning to the next page.

### 1.3.4 Alarm interface

Press
$\square$ key to enter Alarm interface, there are CNC ALARM, PLC ALARM, ALARM LOG pages in this interface, which can be viewed by
 or
 key.

1) PLC ALARM: It displays the numbers of CNC alarm, PLC alarm and the current PLC alarm No., as well as PLC warning and warning No.. It may display 24 PLC alarm or warning No. together. The details for the respective alarm No. can be viewed by moving the cursor. The page is as follows:

Page as the cursor locates at the alarm No. 1000
2) CNC ALARM: It displays the numbers of CNC alarm, PLC alarm and the current CNC alarm No.. It can display 24 CNC alarm No. together. The details for the respective alarm No. can be viewed by moving the cursor. The page is as follows:

Page as the cursor locates at the alarm No. 432
3) WARN LOG: Press key to enter Alarm interface, then press it again to enter the WARN LOG page, which records the latest alarm message including alarm date, alarm time, alarm No. and alarm content. 200 pieces warn log messages can be viewed by
 or
 key. See the following figure:

| WARN LOG |  | PAGE:1 | 00003 N00000 |  |
| :--- | :---: | :---: | :---: | :---: |
| $2009 / 12 / 28 \quad 10: 52: 54$ | $432 \#$ | 1 | $00003 . C N C$ | N0000 |
| Y axis driver is not ready |  |  |  |  |
| 2009/12/28 10:52:54 | 431\# | 1 | $00003 . C N C$ | N0000 |
| X axis driver is not ready |  |  |  |  |
| 2009/12/28 10:52:38 | 431\# | 1 | $00003 . C N C$ | N0000 |
| X axis driver is not ready |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  | S0000 T00 H00 |
|  |  |  |  |  |

(1) Sequence of warn log: the latest alarm log message is shown on the forefront of the $1^{\text {st }}$ page, and the others queue in sequence. If the alarm log messages areover 200, the last one will be cleared.
(2) Manual clearing of warn log: under the 2 level authority, press
 key, it may clear all the warn log messages.
4) Alarm clearing: If multiple alarms are issued, only one alarm where the cursor locates could be key each time (In alarm interface, it clears all alarms and warnings
by pressing
 and

## CANCE

 keys).5) The current alarm page is as florrows:

| CNC ALARM | 00003 N00000 |  |
| :--- | :--- | ---: |
| CNC ALM : 3. |  |  |
| 000 PLC ALM: 432 |  |  |
| CTR WARN: 431 |  |  |
| X axis driver is not ready |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
| MDI | ESP. ALM |  |

Current page

| CNC ALARM | 00003 N00000 |
| :---: | :---: |
| CNC ALM : $2 . \quad$ PLC ALM: 0. | PLC WARN: 0. |
| CTR WARN: 432 |  |
| Y axis driver is not ready |  |
| MDI | S0000 T00 H00 |

Page after pressing RESET key
6) Clearing PLC warning: If multiple warnings are issued, only one warning where the cursor

### 1.3.5 Setting interface

 again, it enters the G54~G59 interface, press it three times, it enters Graphic interface. Press key repeatedly, it switches among the above nentioned interfaces.

## 1.Setting interface

There are 3 pages in this interface, which can be viewed by $\square$ and
 keys.

1) SWITCH SETTING: It is used for displaying the parameter, program, auto sequence No. on / off state.

PARM SWT: when it is turned ON, the parameters are allowed to be modified; it is turned OFF, the parameters are unallowed to be modified.

PROG SWT: when it is turned ON, the programs are allowed to be edited; it is turned OFF, the programs are unallowed to be edited.

AUTO SEG: when it is turned ON, the block No. is created automatically; it is turned OFF, the block No. is not created automatically, input manually if it is needed.

In this page, the state of on/off can be switched by 'left / right'key or 'U'and'D'key on the MDI panel.

2) Data backup: In this page, the CNC data (bit parameter, data parameter, pitch parameter, tool offset) can be saved and restored.

Data backup (user): For CNC data backup by user (save)
Recover backup data (user): For backup data recover by user (read)
Recover standard parameter 1 (test): For reading original parameter data of CNC test by user
Recover standard parameter 2 (step): For reading original parameter data of suited step drive unit by user

Recover standard parameter 3 (servo): For reading original parameter data of suited servo drive unit by user.

| AJTH. OPERATION | 00003 N00000 |  |

| MDI | S0 | T00 H00 |

3) Password setting: Display and set user operation level.

The password of GSK980MDa is composed of 4 levels, including machine builder (level 2), equipment management (level 3), technician (level 4) and machining operation (level 5).

Machine builder (level 2): It allows to modify CNC bit parameter, data parameter, screw- pitch parameter, tool offset parameter, edit part program (including macro program), edit and alter PLC ladder diagram, upload and download ladder diagram.

Equipment management (level 3): Initial password is 12345. The CNC bit parameter, data parameterm screw- pitch parameter, tool offset parameter, part program editing operations are allowed.

Technician (level 4): Initial password is 1234. Tool offset data (for tool setting), macro varibles, part program editing operations are allowed. However, CNC bit parameter, data parameter and pitch parameter editing operations are not allowed.

Machining operation (level 5): No password. Only the mschine panel operation is allowed. The alteration of tool offset data, CNC bit parameter, data parameter, pitch parameter, and the operations of part program selection, program editing are not allowed.

| AUTH. OPERATION | 00003 N00000 |  |

## 1.Setting page of G54~G59 Page location

| SET (G54~G59) |  | 00003 N00000 |  |
| :---: | :---: | :---: | :---: |
| (EXT OFFSET) | (G54 COORDINATE) | (ABSOLUTE) |  |
| X 0.000 | X 0.000 | X | 0.000 |
| Y 0.000 | Y 0.000 | Y | 0.000 |
| Z 0.000 | Z 0.000 | Z | 0.000 |
| (G55 COORDINATE) | (G56 COORDINATE) |  | IINE) |
| X 0.000 | X 0.000 | X | 0.000 |
| Y 0.000 | Y 0.000 | Y | 0.000 |
| Z 0.000 | Z 0.000 | Z | 0.000 |
| DATA |  |  |  |
| MDI |  | S0000 T00 H00 |  |
| SET (G54~-G59) |  | 00003 N00000 |  |
| (G57 COORDINATE) | (G58 COORDINATE) | (ABSOLUTE) |  |
| X 0.000 | X 0.000 | X | 0.000 |
| Y 0.000 | Y 0.000 | Y | 0.000 |
| Z 0.000 | Z 0.000 | Z | 0.000 |
| (G59 COORDINATE) | (COORDINATE OFFSET) |  | IINE) |
| X 0.000 | X 0.000 | X | 0.000 |
| Y 0.000 | Y 0.000 | Y | 0.000 |
| Z 0.000 | Z 0.000 | Z | 0.000 |
| DATA |  |  |  |
| MDI |  |  |  |

The zero of the coordinate system: workpiece coordinate system zero offset, G54, G55, G56, G57, G58, G59.

- Moving of the cursor

The cursor moves at the data of each coordinate system axis. And the data where the cursor
locates are highlighted.
The cursor supports up and down, left and right moving, and the corresponding data are backlighted.

By pressing Page key, the $1^{\text {st }}$ group X axis data on the corresponding interface where the cursor locates is backlighted.

- Absolute data input
 "data" input by user.

The validity judgement of user input data is the same as that of 980TD coordinate data input in MDI mode.

- Relative data input

key" is keyed in by user, the original data where the cursor locates is changed by the sum of"data" newly input by user and original data.
- Auto measurement input
 where the cursor locates is changed by the system current" X (or Z, Y) axis machine coordinate".

## 3. Graphic interface

There are GRAPH SET, GRAPH TRACK pages in this interface, which can be viewed by

and
 keys.

## 1) GRAPH SET page

In this page, the coordinate system, scaling and scope for graphic display can be selected.

| GRAPH SET |  | 00003 N00000 |
| :---: | :---: | :---: |
| - COOR OPT= | 0 0XY 1YX 2ZX 3XYZ 4YZ 5ZY | 6XZ 7XZY) |
| SCALE = | 100\% |  |
| CENTER = | 0.000 (X axis value) |  |
| CENTER = | 0.000 (Y axis value) |  |
| CENTER = | 0.000 (Z axis value) |  |
| X MAX. $=$ | 120.000 |  |
| Y MAX. $=$ | 120.000 |  |
| 2 MAX = | 120.000 |  |
| X MIN. $=$ | -120.000 |  |
| Y MIN. = | -120.000 |  |
| Z MIN. = | -120.000 |  |
| MDI |  | S0000 T00 H00 |

2) GRAPH TRACK page

In this page, it displays the path within the parameters range (refer to absolute coordinate) of GRAPH SET page.

### 1.3.6 BIT PARAMETER, DATA PARAMETER, PITCH COMP interface

PARMEIR
is a compound key, it enters BIT PARAMETER, DATA PARAMETER and PITCH COMP interfaces by pressing this key repeatedly.

## 1. BIT PARAMETER interface

Press PAAMEIR $k$ key, it enters BIT PARAMETER interface, there are 48 bit parameters which are displayed by 2 pages in this interface, and they can be viewed or modified by pressing
 or
$\square$ key to enter the corresponding page. It is as follows:
As is shown in this page, there are 2 parameter rows at the bottom of the page, the $1^{\text {st }}$ row shows the meaning of a bit of a parameter where the cursor locates, the bit to be displayed can be positioned by pressing $\square \square$ parameter where the cursor locates.

| BIT PARAMETER |  |  |  |  | 00003 N00000 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| NO. | DATA | NO. | DATA | NO. | DATA |
| 001 | 00000000 | 009 | 00000000 | 017 | 00101000 |
| 002 | 00000011 | 010 | 00011111 | 018 | 00000000 |
| 003 | 00000000 | 011 | 00000000 | 019 | 10000000 |
| 004 | 01000000 | 012 | 00010011 | 020 | 00000000 |
| 005 | 00010001 | 013 | 10000011 | 021 | 00000000 |
| 006 | 00000000 | 014 | 00011111 | 022 | 00000000 |
| 007 | 00000000 | 015 | 10000000 | 023 | 00000000 |
| 008 | 00011111 | 016 | 00000000 | 024 | 00000000 |
| **** **** **** ALM5 ALM4 ALMZ ALMY ALMX bit7:1/0:Unused <br> NO. 009 |  |  |  |  |  |
|  |  |  |  |  |  |
| JOG |  |  |  |  | S0000 T00 H00 |

2. DATA PARAMETER interface

key if in BIT PARAMETER interface), it enters DATA PARAMETER interface, there are 110 data parameters which are displayed by 7 pages in this interface, and they can be viewed or modified by pressing
 key to enter the corresponding page. It is as follows:

As is shown in this page, there is a cue line at the page bottom, it displays the meaning of the parameter where the cursor locates.

| DATA PARAMETER |  |  |  |  | 00003 N00000 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| NO. | DATA | NO. | DATA | NO. | DATA |
| 049 | 1 | 057 | 1 | 065 | 100 |
| 050 | 1 | 058 | 1 | 066 | 100 |
| 051 | 1 | 059 | 7600 | 067 | 100 |
| 052 | 1 | 060 | 7600 | 068 | 100 |
| 053 | 1 | 061 | 7600 | 069 | 400 |
| 054 | 1 | 062 | 7600 | 070 | 8000 |
| 055 | 1 | 063 | 7600 | 071 | 50 |
| 056 | 1 | 064 | 100 | 072 | 100 |
| Command multiplier for X axis. <br> NO. 049 |  |  |  |  |  |
| JOG |  |  |  |  | S0000 T00 H00 |

## - PITCH COMP interface

Press $\square$ key repeatedly, it enters PITCH COMP interface, there are 256 pitch parameters which are displayed by 16 pages in this interface, and they can be viewed by pressing

key.

| SCREN-PITCH PARMMETER |  |  |  |  |  |  |  | 00000 N00000 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| NO. | X | Y | Z | C | INO. | X | Y | Z | C |
| 000 | 0 | 0 | 0 | 0 | 008 | 0 | 0 | 0 | - |
| 001 | 0 | 0 | 0 | 0 | 009 | 0 | 0 | 0 | 0 |
| 002 | 0 | 0 | 0 | 0 | 010 | 0 | 0 | 0 | 0 |
| 003 | 0 | 0 | 0 | 0 | 011 | 0 | 0 | 0 | 0 |
| 004 | 0 | 0 | 0 | 0 | 012 | 0 | 0 | 0 | 0 |
| 005 | 0 | 0 | 0 | 0 | 013 | 0 | 0 | 0 | 0 |
| 006 | 0 | 0 | 0 | 0 | 014 | 0 | 0 | 0 | 0 |
| 007 | 0 | 0 | 0 | 0 | 015 | 0 | 0 | 0 | 0 |
| $\begin{aligned} & \text { NO. }=\text { XYZC }(0.001 \mathrm{~mm}) \\ & \text { NO. } 000 \end{aligned}$ |  |  |  |  |  |  |  |  |  |
| MDI |  |  |  |  |  |  |  | 000 | H00 |

### 1.3.7 CNC DIAGNOSIS, PLC STATE, PLC VALUE, machine soft panel, VERSION MESSAGE interface

DNGNOSSS
is a compound key, it enters CNC DIAGNOSIS, PLC STATE, PLC VALUE, machine soft panel, VERSION MESSAGE interfaces by pressing this key repeatedly.

## 1, CNC DIAGNOSIS interface CNC

The input/output signal state between CNC and machine, the transmission signal state between CNC and PLC, PLC internal data and CNC internal state can all be displayed via diagnosis. Press
key it enters CNC DIAGNOSIS interface, the keypad diagnosis, state diagnosis and miscellaneous function parameters etc. can be shown in this interface, which can be viewed by pressing
 key.
In CNC DIAGNOSIS page, there are 2 diagnosis No. rows at the page bottom, the $1^{\text {st }}$ row shows the meaning of a diagnosis No. bit where the cursor locates, the bit to be displayed can be positioned by pressing $\square_{\mathrm{L}}$ or $\square_{\mathrm{W}}$ key. The 2nd row shows the abbreviation of all the diaosgnis No. bits where the cursor locates.

| CNC DIAGNOSIS |  |  |  | 00003 N00000 |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| NO. | DATA | NO. | DATA | NO. | DATA |
| -000 | 00000000 | 008 | 00011111 | 016 | 00000000 |
| -001 | 00000000 | 009 | 00011111 | 017 | 00000000 |
| 002 | 00000000 | 010 | 00000000 | 018 | 00000000 |
| 003 | 00001111 | 011 | 00000000 | 019 | 00000000 |
| 004 | 00000000 | 012 | 00000000 | 020 | 00000000 |
| 005 | 00000000 | 013 | 00000000 | 021 | 00000000 |
| 006 | 00011000 | 014 | 00000000 | 022 | 00000000 |
| 007 | 00000000 | 015 | 00000000 | 023 | 00000000 |
| ESP *** $* * *$ DEC5 DEC4 DECZ DECY DECX |  |  |  |  |  |
| bit7:ESP signal (X0.5) |  |  |  |  |  |
| NO. | 000 |  |  |  | S0000 T00 H00 |
| JOG |  |  |  |  |  |

2. PLC STATE interface

In the page of this interface, it orderly displays the state of address X0000~X0029, Y0000~Y0019, F0000~F0255, G0000~G0255, A0000~A0024, K0000~K0039, R0000~R0999 etc..

And it enters PLC STATE interface by pressing
 key repeatedly. The signal state of PLC addresses can be viewed by pressing
 key.
In PLC STATE page, there are 2 rows at the page bottom; the $1^{\text {st }}$ row shows the meaning of a bit of an address where the cursor locates, the bit to be displayed can be positioned by pressing

key. The 2 nd row shows the abbreviation of all the bits of an address where the cursor locates.

| PLC STATE | 00003 N00000 |  |
| :---: | :---: | :---: |
| NO. DATA | NO. DATA | NO. DATA |
| X0000 00000000 | X0008 00000000 | X0016 00000000 |
| X0001 00000000 | X0009 00000000 | X0017 00000000 |
| X0002 00000000 | X0010 00000000 | X0018 00000000 |
| X0003 00000000 | X0011 00000000 | X0019 00000000 |
| X0004 00000000 | X0012 00000000 | X0020 00000000 |
| X0005 00000000 | X0013 00000000 | X0021 00000000 |
| X0006 00000000 | X0014 00000000 | X0022 00000000 |
| X0007 00000000 | X0015 00000000 | X0023 00000000 |
| **** **** DEC5 DEC4 DECY **** **** *** bit7:Unused NO. X0002 |  |  |
|  |  |  |
| JOG |  | S0000 T00 H00 |

3. PLC VALUE interface

In the page of this interface, it orderly displays the values in the registers of T0000~
DuGNOSSS
T0099,D0000~D0999,C0000~C0099,DT000~DT099,DC000~DC099 etc.. By pressing $\qquad$ key repeatedly it enters PLC VALUE interface. The data values of PLC can be viewed by pressing

or
 key.

In this PLC VALUE page, there is a cue line at the page bottom, it displays the meaning of the parameter where the cursor locates. As is shown in the following figure:

| PLC DATA |  |  | 00003 N00000 |  |  |
| :---: | ---: | :--- | :--- | :--- | ---: |
| NO. | DATA | NO. | DATA | NO. | DATA |
| DT000 | 0 | DT008 | 0 | DT016 | 0 |
| DT001 | 0 | DT009 | 0 | DT017 | 0 |

| DT005 | 0 | DT013 | 0 | DT021 | 500 |
| DT006 | 0 | DT014 | 0 | DT022 | 100 |
| DT007 | 0 | DT015 | 0 | DT023 | 500 |
|  |  |  |  |  |  |
| Reserved |  |  |  |  |  |
| NO. DT000 |  |  |  |  | S0000 T00 H00 |
| JOG |  |  |  |  |  |

## 4. VERSION MESSAGE interface

It enters VERSION MESSAGE interface by pressing
$\square$ key repeatedly. The software, hardware, and PLC version message can be shown in this interface. The figure is as follows:

### 1.4 List of general operations

| Item | Function | Operation key | Operatio <br> n mode | $\begin{gathered} \text { Display } \\ \text { page } \end{gathered}$ | Passwor d level | Program on/off | Parameter switch |

Explanations: ". " in the column "operation" indicates operate two keys successively, "+" indicates operate two keys simultaneously.

## CHAPTER 2 POWER ON OR OFF AND PROTECTION

### 2.1 System Power On

Before this GSK980MDa is powered on, the following should be confirmed:

1. The machine is in a normal state.
2. The power voltage conforms to the requirement of the machine.
3. The connection is correct and secure.

The following page is displayed after GSK980MDa is powered on:

The current position (RELATIVE POS) page is displayed after system auto detection and initiation are finished.

### 2.2 System Power Off

Before power is off, ensure that:

1. The axes of the CNC are at halt;
2. Miscellaneous functions (spindle, pump etc.) are off;
3. Cut off CNC power prior to machine power cutting off.

Note: Please see the machine builder's manual for the machine power cut-off operation.

### 2.3 Overtravel Protection

Overtravel protection should be employed to prevent the damage to the machine due to the overtravel of the axes.

### 2.3.1 Hardware overtravel protection

The stroke switches are fixed at the positive and negative maximum travel of the machine axes X , Y, Z, 4th, 5th respectively, they are connected by the following figure. And the "MESP"of bit parameter No. 017 must be setted to 0 . If the overtravel occurs, the stroke switch acts to make the machine stop, and the emergency alarm issues.

When the hardware overtravel occurs, there will be an "emergency stop"alarm. The steps to eliminate this alarm is press the OVERTRAVEL button to reversely move the table to detach the stroke switch (for positive overtravel, move negatively; vice versa).

### 2.3.2 Software overtravel protection

When the "MOT" of bit parameter No. 17 is set to 0 , the software limit is valid.
The software travel stroke is set by data parameter NO.135~ NO.144, they refer to machine coordinate. No.135~No. 139 are for axes (X, Y, Z, 4th, $5^{\text {th }}$ ) positive max.overtravel, № $140 \sim$ № 144 are for negative max.overtravel.

If the machine position (coordinate) exceeds the setting range, overtravel alarm will occur. The steps to eliminate this alarm is press RESET key to clear the alarm, then moves reversely (for positive overtravel, move out negatively; vice versa)

### 2.4 Emergency Operation

During the machining, some unexpected incidents may occur because of the user programming, operation and product fault.So this GSK980MDa should stopped immediately for these incidents. This section mainly describes the resolutions that this GSK980MDa are capable of under the emergency situation. Please see the relative explanation for these resolutions under the emergency by machine builder.

### 2.4.1 Reset

Press key to reset this GSK980MDa system if there are abnormal outputs and axis actions in it:

1. All axes movement stops;
2. M, S function output is invalid (PLC ladder defines whether automatically cut off signals such as spindle CCW/CW, lubrication, cooling by pressing $\qquad$ key);
3. Auto run ends, modal function and state held on.

### 2.4.2 Emergency stop

During machine running, if the emergency button is pressed under the dangerous or emergent situation, the CNC system enters into emergency status and the machine movement is stopped immediately. If the emergency button is released, the emergency alarm is cancelled and the CNC resets. Its circuit wiring is shown in section 2.2.1 of this chapter.
Note 1 Ensure the fault is eliminated before the emergency alarm is cancelled.
Note 2 pressing down the Emergency button prior to power on or off may alleviate the electric shock to the machine system.
Note 3 Reperform the machine zero return operation to ensure the correct position coordinate after the emergency alarm is cancelled (machine zero return operation is unallowed if there is no machine zero on the machine.).
Note 4 Only the MESP of the bit parameter No. 017 is set to 0 , is the external emergency stop valid.

### 2.4.3 Feed hold

Key can be pressed during the machine running to make the running pause. However, in thread cutting, cycle running, this function can not stop the running immediately.

### 2.4.4 Power off

Under the dangerous or emergency situations during the machine running, the machine power should be cut off immediately to avoid the accidents. However, it should be noted that there may be a big error between the CNC displayed coordinate and the actual position. So the tool setting operation should be performed again.

## CHAPTER 3 MANUAL OPERATION

key, it enters Manual mode. In this mode, the manual feed, spindle control, override adjustment operations can be performed.

## Note!

The keys functions of this 980MDa machine panel are defined by Ladder Diagram; please refer to the respective materials by the machine builder for the function significance.

Please note that the following function introduction is described based on the 980MDa standard PLC programs!

### 3.1 Coordinate axis moving

In Manual mode, the coordinate axis can be moved manually for feeding and rapid traverse.

### 3.1.1 Manual feed

Press feed axis and axis direction key in the direction selection
 negatively, and the axis stops moving if releasing these two keys; and the direction selection keys of X. Y. Z. 4th. 5th axes can be hold on at a time to make the 5 axes to move simultaneously.

### 3.1.2 Manual rapid traverse

up. The corresponding axis can be rapidly moved positively or negatively by pressing direction selection key, and the axis stops moving if releasing the key; and the direction selection keys of X . Y . Z. 4th. 5th axes can be hold on at a time to make the 5 axes to move simultaneously.

In Manual rapid mode, press | On |
| :--- | :--- | key to make the indicator go out, and the rapid traverse is invalid, it enters the Manual feed mode.

Note 1: Before machine zero return, the validity of manual rapid traverse is set by the "ISOT" of the bit parameter No. 012.

Note 2: In Edit or MPG mode, $\begin{aligned} & \text { URPD } \\ & \text { key is invalid. }\end{aligned}$

### 3.1.3 Manual feedrate override adjustment

In Manual mode, the
 or
 key in
 can be pressed to modify the Manual feedrate override, and the override has 16 levels. The relation of the feedrate override and the feedrate is as the following table:

| Feedrate override (\%) | Feedrate (mm/min) |
| :---: | :---: |
| 0 | 0 |
| 10 | 2.0 |
| 20 | 3.2 |
| 30 | 5.0 |
| 40 | 7.9 |
| 50 | 12.6 |
| 60 | 20 |
| 70 | 32 |
| 80 | 50 |
| 90 | 79 |
| 100 | 126 |
| 110 | 200 |
| 120 | 320 |
| 130 | 500 |
| 140 | 790 |
| 150 | 1260 |

Note: There is about $\mathbf{2 \%}$ fluctuating error for the data in the table.

### 3.1.4 Manual rapid override adjustment

the manual rapid traverse
 or
 key in
 can be pressed (also

 key with the respective override F0, $25 \%, 50 \%, 100 \%)$ to modify the Manual rapid override, and there are 4 gears of F0, $25 \%, 50 \%, 100 \%$ for the override.(F0 is set by data parameter No.069)

### 3.1.5 Relative coordinate clearing

RELATIVE POS page;

2) Press $\not \approx$ key to make the " $X$ "in the page to blink, then press | CNNCE |
| :---: | :---: | :---: |

3) The clearing operations of other coordinates are the same as above.

### 3.2 Other Manual operations

Note: The following operations are also valid in Machine zero, MPG/Step mode.

### 3.2.1 Spindle CCW, CW, stop control

| $\bigcirc-1010$ |
| :---: |
| S. CW |

In Manual mode, the spindle stops if pressing this key;

In Manual mode, the spindle rotates clockwise if pressing this key;

### 3.2.2 Spindle Jog

 key, the spindle rotates conterclockwise, release it, the spindle stops.

### 3.2.3 Cooling control

In Manual mode, press this key, the coolant is switched on/off.。

### 3.2.4 Lubrication control

See details in Appendix for its function.

### 3.2.5 Spindle override adjustment

In Manual mode, if the spindle speed is controlled by analog voltage output, the spindle speed may be adjusted.

## CHAPTER 4 MPG/STEP OPERATION

In MPG/Step mode, the machine moves by a specified increment.

## Note!

The keys functions of this 980MDa machine panel are defined by Ladder; please refer to the respective materials by the machine builder for the function significance.

Please note that the following function introduction is described based on the 980MDa standard PLC programs!

### 4.1 Step Feed

Set the BIT3 of the bit parameter No. 001 to 0, and press
key to enter the Step mode, it displays as follows:

| RELATIVE POS |  | 00000 NO 0090 |
| :---: | :---: | :---: |
|  |  | $\begin{array}{llll}\text { G00 } & \text { G17 } & \text { G90 } & \text { G54 } \\ \text { G21 } & \text { G40 } & \text { G49 } & \text { G94 }\end{array}$ |
|  | $0 \cdot 707$ | F0100 S 00 M30 |
|  |  | STEP INC: 0.001 |
|  | 0.070 | ACT. F: 0 |
|  |  | FED OVRI: 150\% |
|  | 0.770 | RAP OVRI: 100\% |
| $7$ |  | SPI OVRI: 100\% |
|  |  | PART CNT: 2 |
|  |  | CUT TIME: 0:00:02 |
| STEP |  | S0000 T01 H00 |

### 4.1.1 Increment selection

 the page..
 MDI modes, rapid override will be changed by pressing the above-mentioned keys. In
the MANUAL mode, press rapid move key

| ${ }^{\circ} \Omega \times 1$ |
| :--- |
| $\Omega R_{2} \mathrm{Fa}$ | | ת $\Omega \times 10$ |
| :--- |
| $几 256$ |

 תximo ru40 keys together, these keys are valid, otherwise, they are invalid.

### 4.1.2 Moving direction selection

Press

$\square$ key once, $X$ axis can be moved negatively or positively by a step increment, other axises are the same.

### 4.2 MPG (Handwheel) Feed

Set the BIT3 of the bit parameter No. 001 to 1, and press

key to enter the MPG mode, it displays as following:

The handwheel figure is as follows:

The handwheel figure

### 4.2.1 Increment selection

 the page:

### 4.2.2 Moving axis and direction selection

In MPG mode, press
 key to select the corresponding axis. The page is as follows (Other axises are the same):

The handwheel feed direction is defined by its rotation direction. Generally, the handwheel CW is for positive feed, and CCW is for negative feed. In case of that handwheel CW is for negative feed, CCW for positive feed, it may exchange the A, B signals of the handwheel terminals, also you can modify the HNGX. HNGY. HNGZ. HNG4. HNG5 of the bit parameter №019.

### 4.2.3 Explanation items

1. The correspondence between the handwheel scale and the machine moving amount is as following table:

|  | Moving amount of each handwheel scale |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Handwheel increment | 0.001 | 0.0100 | 0.100 | 1.000 |
| Specified coordinate value | 0.001 mm | 0.010 mm | 0.100 mm | 1.000 mm |

2. The rotation speed of the handwheel should be less than $5 \mathrm{r} / \mathrm{s}$, if it is over that, the scale may be not coincide with the moving amount
3. The handwheel axis selection key is valid only in the MPG mode.

## CHAPTER 5 MDI OPERATION

In MDI mode, the operations of parameter setting, words input and execution can be performed.

## Note!

The keys functions of this 980MDa machine panel are defined by Ladder; please refer to the respective materials by the machine builder for the function significance.

Please note that the following function introduction is described based on the 980 MDa standard PLC programs!

### 5.1 Code Words Input

Select MDI mode to enter the PRG STATE page, to input an block "G00 X50 Z100", the steps are as follows:

1. Press

2. Press

| PRG STATE |  | 00000 N00000 |
| :---: | :---: | :---: |
| ( ABSOLLJTE ) | (Mode of fixed cycle) | G00 G17 G90 G54 |
| X 0.000 X | V | G21 G40 G49 G94 G98 |
| $\mathrm{Y} \quad 0.000 \quad \mathrm{Y}$ | W | F0100 S 00 M 30 |
| $\begin{array}{lll}\mathrm{Z} & 0.000 & \mathrm{Z} \\ \mathrm{R}\end{array}$ | P | PRG. F: 100 |
| 20.000 R | Q | ACT. F: 0 |
| INPUT PRG SEGMENT: |  | FED OWRI: 150\% |
| - |  | RAP OFRI: 100\% |
|  |  | SPI OVRI: 100\% |
|  |  | PART CNT: 2 |
|  |  | CUT TIME: 0:00:02 |
| MDI |  | S00日0 T01 H00 |

3. Input

$\square$

by sequence, the page is as follows:

| PRG STATE |  | 00000 N00000 |
| :---: | :---: | :---: |
| (ABSOLITE) | (Mode of fixed cycle) | G00 G17 G90 G54 |
| X 0.000 X | V $V$ | $621 \quad 640649694 G 98$ |
| Y O.000 Y | W | F0100 S 00 M30 |
| 70.000 Z | P | PRG. F: 100 |
| 20.000 R | Q | ACT. F: 0 |
| INPUT PRG SEGMENT: |  | FED OWRI: $150 \%$ |
| $600 \mathrm{X} 50 \mathrm{Y} 50 \mathrm{Z100}$ |  | RAP OVRI: 100\% |
|  |  | SPI OVRI: 100\% |
|  |  | PART CNT: 2 |
|  |  | CUT TIME: 0:00:02 |
| MDI |  | S0000 T01 H00 |

4. Press

the page is as follows:

| FRG STATE |  | 00000 N00000 |
| :---: | :---: | :---: |
| ( ABSOLUTE ) | (Mode of fixed cycle) | G00 G17 G90 G54 |
| X 0.000 X | (hode of V | G21 G40 G49 G94 G98 |
| Y 0.000 Y | W | F0100 S 00 M30 |
| Y 0.090 | P | PRG. F: 100 |
| Z 0.000 R | Q | ACT. F: 0 |
| INPUT PRG SEGMENT: |  | FED OVRI: 150\% |
| G00 X50 Y50 Z100 |  | RAP OVRI: $100 \%$ |
|  |  | SPI OVRI: 100\% |
|  |  | PART CNT: 2 |
|  |  | CUT TIME: 0:00:02 |
| MDI |  | S0000 T01 H00 |

### 5.2 Code Words Execution

MDI words execution.If key is pressed,the background color of program segment will becomes black,then words can be input again.

Note: The subprogram call command (M98 P ; etc.) is invalid in MDI mode.

### 5.3 Parameter Setting

In MDI mode, the parameter value can be modified after entering the parameter interface. See details in Chapter 9 of this part.

### 5.4 Data Modification

In the PRG STATE page, before the inputted words will be executed, if there is an error in

## CANCR

inputted words, press $\qquad$ to cancel highligt state, then program segment can be
$\qquad$ key to clear all the words, then input the correct words; for modified. It may press example ,"Z1000" will be inputted to replace Z100 in Section 5.1 of this chapter, the steps are as follow.

CANCE

1. press_key, the page is as follows:

| FRG STATE |  | $00000 \mathrm{N00000}$ |
| :---: | :---: | :---: |
| (ABSOLUTE) | (Mode of fixed cycle) | G00 G17 G90 G54 |
| X 0.000 X | V | G21 G40 G49 G94 G98 |
| Y 0.000 Y | ${ }^{W}$ | F0100 S 00 M30 |
| $0.000{ }^{2}$ | P | FRG. F: 100 |
| $20.000 \quad \mathrm{R}$ | 0 | ACT. F: 0 |
| INPUT PRG SEGMENT: |  | FED OVRI: 150\% |
| $900 \mathrm{X} 50 \mathrm{Y} 50 \mathrm{Z100}$ _ |  | RAP OVRI: 100\% |
|  |  | SPI OVRI: 100\% |
|  |  | FART CNT: 2 |
|  |  | CUT TIME: 0:00:02 |
| MDI |  | S0000 T01 H00 |

CANCB
2. press key, the page is as follows:

### 5.5 OUT Key Start

## CHAPTER 6 PROGRAM EDIT AND MANAGEMENT

In Edit mode, the programs can be created, selected, modified, copied and deleted, and the bidirectional communication between CNC and CNC, or CNC and PC can also be achieved. To prevent the program to be modified or deleted accidentally, a program switch is set for this GSK980MD system. And it must be turned on before program editing. Also 3 level user authority is set in this GSK980MD system to facilitate the management. Only the operation authority is above 4 level ( 4 or 3 level etc.) can open the program switch for program editing.

### 6.1 Program Creation

### 6.1.1 Creation of the block number

The program can be with or without a block No. The program is executed by the block numbered sequence (except the calling). When the "AUTO SEG"switch in setting page is OFF, the CNC doesn't generate the block number automatically, but the blocks may be edited manually.

When "AUTO SEG" switch in switch setting page is on, the CNC generates the block number The increment of this block number is set by №216.

### 6.1.2 Input of the program content

1
 key to enter the Edit mode;

by pressing

| PRG CONTENT | SEG1 | COL:1 | C:/00000.CNC |
| :---: | :---: | :---: | :---: |
| $\begin{aligned} & 00000 \text { (00000); } \\ & \text { G0 G54 G90 X0 Y0 Z0; } \\ & \mathrm{X} 10 \text { Y10; } \\ & \mathrm{X}-10 \mathrm{Y}-10 ; \\ & \mathrm{M} 99 ; \\ & \mathrm{X} \end{aligned}$ |  |  |  |
| EDIT |  |  | S0000 |

 key by sequence (e.g. Program O0001 creation);

| PRG CONTENT | SEG1 | COL:1 | C:/O0000. CNC |

|  |  |  |  |
|  |  |  |  |
| EDIT |  |  |  |

## EOR

4 Press $\qquad$ key to setup the new program;

5 Input the edited part program one by one, the character will be displayed on the screen immediately as it is input(as for compound key, press this key repeatedly for alternate
input),after a block is finished, press
6 Other blocks cab be input by step 5 above.

### 6.1.3 Search of the character

## 1 Scanning: To scan the character one by one by cursor

CONTENT page;
 key, the cursor shifts a line upward; if the number of the column where the cursor locates is over the total columns of the previous line, the cursor moves to the previous

2) Press key, the cursor shifts a line downward; if the number of the column where the cursor locates is over the total columns of the next line, the cursor moves to the next block end
(at";"sign) after the
 key is pressed;
3) Press
 key, the cursor shifts a column to the right; if the cursor locates at the line end, it moves to the head of the next block;
4) Press
 key, the cursor shifts a column to the left; if the cursor locates at the line head, it moves to the end of the next block;
5) Press key to page upward, the cursor moves to the $1^{\text {st }}$ line and the $1^{\text {st }}$ column of the previous page, if it pages to the head of the program, the cursor moves to the $2^{\text {nd }}$ line and $1^{\text {st }}$ column;
6) Press key to page downward, the cursor moves to the $1^{\text {st }}$ line and $1^{\text {st }}$ column of the next page, if it pages to the end of the program, the cursor moves to the last line and $1^{\text {st }}$ column of the program;

2 Searching: To search for the specified character upward or downward from the cursor current location
The steps of searching are as follows:

1) Press

2) Press
 key to enter the PRG CONTENT page;

## CHANGE

3) Press key to enter Search mode, Max. 50 bytes can be input, but only 10 of them can be searched. If the characters are over 10 bytes, searching will fail. E.g. to

search command ——G2, press $\quad$ key, then input G2, and operate as step 4.

| PRG CONTENT | ITOR SEG8 | COL:1 | C:/O0008. CNC |
| :--- | :--- | :--- | :--- |
| O0008 (CNC PROGRAM); |  |  |  |
| G40 G49 G80; |  |  |  |
| G0 G90 G54 X0 Y0 Z0; |  |  |  |
| Z50; |  |  |  |
| G1 X20 Z20 F1500; |  |  |  |
| 32 I-20; |  |  |  |
| G3 I-20; |  |  |  |
| G4 X5; |  |  |  |
| G1 X0 Y20 Z0 F1000; |  |  |  |
| X-20 Y0; |  |  |  |
| FIND G2 |  | S0000 T00 H00 |  |
| EDIT |  |  |  |

4 )

by the location relation between the character to be searched and the character where the cursor locates), it displays as follows:

| PRG CONTENT | ITOR SEG8 | COL:1 | C:/00008. CNC |
| :--- | :--- | :--- | :--- |
| O0008 (CNC PROGRAM); |  |  |  |
| G40 G49 G80; |  |  |  |
| G0 G90 G54 X0 Y0 Z0; |  |  |  |
| Z50; |  |  |  |
| G1 X20 Z20 F1500; |  |  |  |
| G2 I-20; |  |  |  |
| G3 I-20; |  |  |  |
| G4 X5; |  |  |  |
| G1 X0 Y20 Z0 F1000; |  |  |  |
| X-20 Y0; |  |  |  |
| FIND G2 |  | S0000 T00 H00 |  |
| EDIT |  |  |  |

5) After the searching, the CNC system is still in searching state, press or

key
again, the next character can be searched. Or press $\quad$ key to exit the searching state.
6) If the character is not found, the prompt of "Srch fail" will be displayed.

Note:During the searching, it doesn't search the characters in the called subprogram
3 Method to return to the program head

1) In the Program Display page of the Edit mode, press kesea key the cursor returns to the program head
2) Search the program head character by the methods in Section 6.1.3 of this part.

### 6.1.4 Insertion of the character

Steps:

1) Select the PRG CONTENT page in Edit mode, the page is as follows:

| PRG CONTENT | SEG5 | COL: 1 | C:/O0008. CNC |
| :--- | :--- | :--- | :--- |
| O0008 (CNC PROGRAM); |  |  |  |
| G40 G49 G80; |  |  |  |
| G0 G90 G54 X0 Y0 Z0; |  |  |  |
| Z50; |  |  |  |
| G1 X20 Z20 F1500; |  |  |  |
| G2 I-20; |  |  |  |
| G3 I-20; |  |  |  |
| G4 X5; |  |  |  |
| G1 X0 Y20 Z0 F1000; |  |  |  |
| X-20 Y0; |  |  |  |
| EDIT |  | S0000 T00 H00 |  |

2) Input the character to be inserted(to insert G98 code before G2 in the above figure,

| PRG CONTENT | SEG5 | COL:5 | C:/O0008. CNC |
| :--- | :--- | :--- | :--- |
| 00008 (CNC PROGRAM); |  |  |  |
| 640 G49 G80; |  |  |  |
| G0 G90 G54 X0 Y0 Z0; |  |  |  |
| Z50; |  |  |  |
| G1 X20 Z20 F1500; |  |  |  |
| $G 98$ G2 I-20; |  |  |  |
| G3 I-20; |  |  |  |
| $G 4$ X5; |  |  |  |
| $G 1$ X0 Y20 Z0 F1000; |  |  |  |
| X-20 Y0; |  |  |  |
| EDIT |  |  |  |

Note 1:In the Insert mode, if the cursor is not located at the line head, a space will be automatically generated when inserting the command address; if the cursor is located at the line head, the space will not be generated, and it should be inserted manually.

Note 2: In program content edit mode or MDI mode of program state page, press \begin{tabular}{|l|l|}

\hline | AITER |
| :--- | :--- |
| MCDO |
| EDT | <br>

key to
\end{tabular} enter insertion or macro edit state.

In macro editting mode, special symbols can be input are: '['. ']’. ‘='. ‘+'. '>'. ‘<'. 'l'. '\&'. '|'.
Above symbols are frequently used for macro edit.

| Difference between <br> two states | Automatic space | Process of character 'O' | Input special <br> symbols |
| :---: | :--- | :--- | :---: |
| Insertion state | In program editting, <br> insert blank automatically <br> to separate words. | Program switch, duplication <br> and deletion can be done <br> by pressing 'O'. | Special symbols <br> can not be <br> inputted. |
| Macro edit state | Blank can not be inserted <br> automatically. | Only input character 'O'. | Special symbols <br> can be inputted. |

### 6.1.5 Deletion of the character

Steps:

1) Select the PRG CONTENT page in Edit mode;
2) Press $\begin{aligned} & \text { CANCE } \\ & \\ & \\ & \text { key to delete the character before the cursor; press } \\ & \text { DEIERE }\end{aligned}$ key to delete the character where the cursor locates.

### 6.1.6 Modification of the character

Cancel or delete the character and re-enter new ones.

### 6.1.7 Deletion of a single block

This function is only applied to the block with a block No.(N command), which is at the head of a line and followed by blocks which are divided by space.

Steps:

1) Select the PRG CONTENT page in Edit mode;
2) Move the cursor to the head of the block to be deleted (column 1 - where N locates), then

Note: If the block has no block No.N, key in "N"at the head of the block, and move the cursor
to "N", then press

### 6.1.8 Deletion of the blocks

It deletes all the content (including the specified block)from the current character where the cursor locates to the block with the specified No.(searching downward), and the
specified block must has a block No..

| PRG CONTENT | SEG5 | COL:5 | C:/00008. CNC |

| FIND F1000 |  |  |  |
| EDIT |  |  |  |

 displays as follows:

| PRG CONTENT | SEG2 | COL:5 | C:/00008.CNC |
| :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { O0008 (CNC PROGRAM); } \\ & G 40 \text { G49 G80; } \\ & G 3 \text {; } \\ & X-20 \text { Y0; } \\ & X 0 Y-20 ~ Z-10 ; \\ & X 20 \text { Y0 } Z-20 ; \\ & X 5 \text { Y5 Z-50; } \\ & M 99 ; \\ & X \end{aligned}$ |  |  |  |
| EDIT |  |  | S0000 T00 |

Note 1:If the specified character is not found or the specified character is located before the current cursor, the prompt of "Srch fail" will be displayed. If there are multiple same characters specified downward, it defaults the nearest one to the current cursor.

Note 2: If the command address is input, both the address and the command value behind it are Deleted.

### 6.2 Program annotation

To facilitate the user to search, manage and edit program, the system provides program name annotation and block annotation functions.

### 6.2.1 Annotation for program name

The program annotation can be added in the brackets behind it. For exa mple: program O0005 is used for machining bolt holes, the annotation can be added in program contents as follows:

1) Select edit mode, and then enter program content display page.

CHANGE
2) Press key, search is displayed at the left bottom of the screen, the displayed figure is as follows:

3) Input annotation behind search (input max. 50 characters except for brackets). If BOLT PROC is inputted (bolt holes machining ), the page displayed is as follows:

4) Press | $\substack{\operatorname{DRTSA} \\ \operatorname{INP} / \pi}$ |
| :---: | key, program annotation setting up is finished, the displayed page is as follows:

| PRG CONTENT SEG1 COL:1 C:/O0005. CNC |
| :--- |
| 00005 (BOLT PROC); |
| G90 G00 X0 Y0 Z0; |
| (I:cir r, A:first hole angle, B:angle inc, H:hole number); |
| G65 P9020 X100 Y50 R30 Z-50 F1800 I100 A45 B30 H5; |
| M30; |
| $\%$ |
|  |
|  |
| EDIT |

### 6.2.2 Block annotation

Take contents in brackets ' ('and') 'as program annotation, which can be put at any position of a block and displayed with green characters. The page is as follows:

## Related explanations:

1)Because symbols'('and ')'are not provided in the system, block annotation can not be inputted by edit mode in the system. If block annotation is needed to added, edit annotation on the PC and download it to the CNC by software.
2) The system is not support Chinese characters. If Chinese characters are edited on PC, which will be displayed as blanks in the system after it is saved in the CNC.

Note 1: After a program is set up, if the program name annotation is not added, CNC defaults program name as program name annotation
Note 2: Program annotation in the CNC must be English, but the CNC supports Chinese annotation display (except for Chinese decimal points). The way of adding Chinese annotation is as follows: Edit Chinese annotation in the PC machine, and then download it to the CNC by communication software.

### 6.2.3 Alter program annotation

Operation steps are the same as program annotation setting steps on section 6.2.1 of this chapter.

### 6.3 Deletion of the Program

### 6.3.1 Deletion a single program

Steps:

1) Select the PRG DISPLAY page in Edit mode;
2) Key in address key , numerical key
 sequence( take program O0001 for an example);
3) Press key, program $O 0001$ will be deleted

Note: Press 'DELETE ' key in page 'program preview'or'file list'to delete program.

### 6.3.2 Deletion of all programs

Steps

1) Select the PRG DISPLAY page in Edit mode

by sequence
3 ) Press DAIETE key, all the programs will be deleted.
Note: Press 'delete key'in page 'file list'to delete all programs.

### 6.4 Selection of the Program

When there are multiple programs in CNC system, a program can be selected by the following 4 methods:

### 6.4.1 Search method

1) Select Edit mode;
2) Press PAOGNM
3) Press address key
 and key in the program No.;
4) Press
 ㄷㅇㄹ key, the searched program will be displayed.

Note:In step 4, if the program does not exist, a new program will be created by CNC system after EOD key is pressed

### 6.4.2 Scanning method

1) Select Edit or Auto mode;

2) Press $\qquad$ key to enter the PRG DISPLAY page;
3) Press address key

4) Press
 key to display the next or previous program;
5) Repeat step 3 and 4 to display the saved programs one by one.

### 6.4.3 Cursor method

1) In Program Preview mode (must be in non-running state);

2) Press
 key to move the cursor to the program name to be selected (change "PRG SIZE", "NOTE" content as the cursor moves);
3) Press
$\square$ to open the program.

### 6.4.4 Select file by using file list

1) On file list page (Edit mode is operation mode)

2) Select program to be opened by pressing

3) Open program by pressing
$\square$
key.

### 6.5 Execution of the Program

After the program to be executed is selected by the method in Section 6.4 of this part,
select the Auto mode, then press
 program will be executed automatically.

### 6.6 Rename of the Program

1) Select the PRG CONTENT page in Edit mode;
2) Press address key
 and key in the new program name;
3) Press $\xlongequal{\substack{\text { Mucho } \\ \text { EiI }}}$ key

Note: No matter whether the program is altered or not, program annotation is changed into new program name automatically after program is renamed.

### 6.7 Copy of the Program

To save the current program to a location:

1) Select the PRG CONTENT page in Edit mode;
2) Press address key $\square$ and key in the new program No

### 6.8 Program positioning

- To the position where the program stops last time by TO

Search for the point where the program execution stops by TO. Select edit mode to enter program content page and press conversion key, input TO to search which is displayed at the left bottom. Then press up or down key, searching and positioning are displayed at this time, the cursor will move to the position where program stops last time.

- Position to specified block by TO+num (num is the block number specified by user. For example: TO10000 means position to the $10000^{\text {th }}$ block)

On program content page, locate to specified block by inputing TO block number. Press conversion key after entering program content page, input TO to search which is displayed at the left bottom and then press up or down key, the cursor will move to the specified program.

### 6.9 Program preview

In non-edit mode, press PROGPAM names saved in CNC are displayed in the form of list. Max. 36 program names can be displayed In one page, if programs saved are over 36 , press
 page.

- Program capacity display:

On top right window, "storage capacity"displays the max. capacity of program which can be saved in CNC. "Used capacity"displays the capacity of saved program in CNC system.. "Program
number"displays the program number saved in the CNC system. "Program size"displays the size of the currently opened program.

- Program preview selection:

On top left of the window, the name of currently previewed program will be displayed in blue characters on white ground. Program size on top left window is the size of currently previewed program. The following window displays currently previewed progam, display 5 -line program.

- Usage of cursor key and conversion key:

When select program in a program list, select the program to be previewed by cursor moving key on MDI panel. If the size is very big, max. 36 program names can be displayed in program list. Select program by pressing right moving key or pressing conversion key directly, turn pages to display the program list, and then select it by cursor moving key on MDI panel.

- Open a program:

In edit, auto, MDI modes, when open the program on program preview window, this program can be opened by pressing EOB key on MDI panel. At the same time, the name of currently opened program is displayed on top right page.

- Deletion of program

Move cursor to the program will be deleted, press delete key and then press Y key or N key on multiple select manue to select wether delete it or not

## CHAPTER 7 AUTO OPERATION

## Note!

The keys functions of this 980MDa machine panel are defined by Ladder; please refer to the respective materials by the machine builder for the function significance.

Please note that the following function introduction is described based on the

### 7.1Auto Run

### 7.1.1 Selection of the program to be run

1. Search method
1) Select the Edit or Auto mode;

2) Press
 key to enter the PRG CONTENT page;
3) Press the address key
 and key in the program No.
4) Press
 or
 key, the program retrieved will be shown on the screen, if the program doesn't exist an alarm will be issued
Note In step 4, if the program to be retrieved does not exist, a new program will be setup by CNC system after pressing

## 2 Scanning method

1) Select the Edit or Auto mode
2) $\square$ key to enter the PRG display page
3) Press the address key

4) Press the
 or
 key to display the next or previous program;
5) Repeat the step 3, 4 above to display the saved program one by one.

## 3 Cursor method

a) Select the Auto mode (must in non-run state)
b) Press key to enter the PRG LIST page;
c) Press
 name of the program to be selected;
d) Press ${ }^{\text {key. }}$

## 4. File open method

Select the edit or operation mode:

1) Press

PROGFAM key twice to enter the page of file list.;
2) Press
 keys to move the cursor to the file will be selected.
3) Press $\square$ key to select a file.

ㄷNㄹㄹ
4) Press
 key to open the selected file.

Note: The file can not be opened if the expanded name is not".CNC".

### 7.1.2 Program start

### 7.1.3 Stop of the auto run

- Stop by command (M00)
the block containing M00 is executed, the auto run is stopped. So the modal function and state
are all reserved. Press the key
${ }^{\circ}$ 估
craf stem or the external Run key, the program execution continues.
- Stop by a relevant key

(1) The machine feed decelerate to stop;
(2) During the execution of the dwell command (G04), it pauses after G04 command execution is finished.
(3) The modal function and state are saved;
(4) The program execution continues after pressing the

## 2 Stop by Reset key

$\square$
(1) All axes movement is stopped.
(2) $\mathrm{M}, \mathrm{S}$ function output is invalid (the automatic cut-off of signals such as spindle CCW/CW,

(3) Modal function and state is held on after the auto run.

## 3 Stop by Emergency stop button

If the external emergency button (external emergency signal valid) is pressed under the dangerous or emergent situation during the machine running, the CNC system enters into emergency state, and the machine moving is stopped immediately, all the output (such as spindle rotation, coolant) are cut off. If the Emergency button is released, the alarm is cancelled and CNC system enters into reset mode.

## 4 By Mode switching

When the Auto mode is switched to the Machine zero, MPG/Step, the current block "dwells"immediately; when the Auto mode is switched to the Edit, MDI mode, the "dwell"is not displayed till the current block is executed.

## Note 1 Ensure that the fault has been resolved before cancelling the emergency alarm.

Note 2 The electric shock to the device may be decreased by pressing the Emergency button before power on and off.
Note 3 The Machine zero return operation should be performed again after the emergency alarm is cancelled to ensure the the coordinate correctness (but this operation is unallowed if there is no machine zero in the machine)

Note 4 Only the BIT3 (ESP) of the bit parameter No. 017 is set to 0 , could the external emergency stop be valid.

### 7.1.4 Auto run from an arbitrary block

 interface, or press pagQwn key several times to select the PRG CONTENT page:
2. Move the cursor to the block to be executed (for example, move the cursor to the 3th line head if it executes from the 3th line);

| PRG CONTENT | SEG3 | COL:1 | C:/00000. CNC |
| :--- | :--- | :--- | :--- |
| O0000 (00000); |  |  |  |
| G0 G54 G90 X0 Y0 Z0 G49; |  |  |  |
| G01 X100 Y100 F500; |  |  |  |
| G02 I20; |  |  |  |
| G01 X52 Z01; |  |  |  |
| G91 X2 Z-6.3; |  |  |  |
| G00 X0 Y0 Z0; |  |  |  |
| M30; |  |  |  |
| $\%$ |  | S0000 T00 H00 |  |

3. If the mode ( $\mathrm{G}, \mathrm{M}, \mathrm{T}, \mathrm{F}$ command) of the current block where the cursor locates is defaulted and inconsistent with the running mode of this block, the corresponding modal function should be executed to continue the next step.

### 7.1.5 Adjustment of the feedrate override, rapid override

In Auto mode, the running speed can be altered by adjusting the feedrate override, rapid override with no need to change the settings of the program and parameter.

- Adjustment of the feedrate override

Press the

key in

Wn\%
E. OVPFRE adjustment.

Press the $\stackrel{\circ}{\text { ® }}$ key each time, the feedrate override ascends a gear level till $150 \%^{\circ}$

Press the
 key each time, the feedrate override decends a gear level till 0 ;

Note 1 The actual feedrate value is specified by F in program feedrate override adjustment;
Note 2 Actual feedrate= value specified by F×feedrate override

- Adjustment of rapid override

It can realize the 4-level real time rapid override Fo. $25 \% .50 \% .100 \%$ adjustment by pressing the
 key each time, the rapid override ascends a level till 100\%;
 key each time, the rapid override decends a level till F0

Note 1 The max. rapid traverse speeds of $X, Y, Z$ axis are set by bit parameter No.059, No.060, No. 061 respectively;

X axis actual rapid traverse rate $=$ value set by parameter No.059×rapid override
Y axis actual rapid traverse rate $=$ value set by parameter No.060×rapid override
$Z$ axis actual rapid traverse rate $=$ value set by parameter No.061×rapid override
Note 2 When the rapid override is FO, the rapid traverse rate is set by bit parameter No. 069 .

### 7.1.6 Spindle override adjustment

While the spindle speed is controlled by the analog voltage output in Auto mode, it can be adjusted by spindle override.

to adjust the spindle override for the spindle speed, it can realize 8 -level real-time override adjustment between $50 \% \sim 120 \%$.

key each time, the feedrate override ascends a level till $120 \%$

Press the
 key each time, the rapid override decends a level till $50 \%$.

Note 1 The actual output analog voltage=analog voltage by parameter×spindle override Example: When the bit parameter No. 101 is set to 9999, No. 100 to 645, execute S9999 command to select the spindle override $70 \%$, the actual output analog voltage $\approx 10 \times 70 \%=7 \mathrm{~V}$

### 7.2 DNC running

This CNC system has a DNC function, by the connection of the DNC communication software with this system, the high speed, high capacity program can be performed in this system.
 start the program DNC machining under the condition that the PC is get ready

Please refer to the DNC communication software for details.

### 7.3 Running state

### 7.3.1 Single block execution

When the program is to be executed for the $1^{\text {st }}$ time, to avoid the programming errors, it may select Single block mode to execute the program.

In Auto mode, the methods for turning on single are as follows.
 light up, it means that the single block function has been selected

In Single block mode, when the current block execution is finished, the CNC system stops;if

Note Even at the mid point, the single block stops in G28,G29, G30 commands

### 7.3.2 Dry run

Before the program is to be executed, in order to avoid the programming errors, it may select the Dry run mode to check the program. And the machine runs by a constant speed other than the speed specified by the program.

In Auto mode, the method for turning on the Dry run switch are as follows.

Press | ${ }^{\circ} \bar{\pi}$ |
| :---: |
| ${ }^{\circ}$ DRY | key to make the dry run indicator in State area to light up, it means that the dry run function is selected

The speed specified by the program is invalid in Dry run, and actural feedrate is set by the DATA parameter No. 174.

### 7.3.3 Machine lock

In Auto mode, the ways to make machine lock function valid are as follows.
 means that it has enterd the machine lock state.

While in the machine lock mode:

1. The machine carriage doesn't move, the "MACHINE"in the INTEGRATED POS page of the POSITION interface doesnt' vary too. The RELATIVE POS and ABSOLUTE POS, DIST TO GO are refreshed normally
2. M, S, T commands can be executed normally.

### 7.3.4 MST lock

In Auto mode, the ways to make MST lock function valid are as follows.
 key to make the MST lock indicato $\qquad$ in State area to light up, it means that it has entered the MST lock state. And the carriage move is not performed by M, S, T

## commands

Note: When the MST lock is valid, it has no effect on the execution of M00, M30, M98,M99.

### 7.3.5 Block skip

If a block in program is not needed to be executed and not to be deleted, this block skip function can be used. When the block is headed with "/"sign and Block skip function is valid, this block is skipped without execution in Auto mode

In Auto mode, the way to make block skip function valid is as follows.
 that the block skip function is valid.

Note While the block skip function is invalid, the blocks headed with "/"signs are executed normally in Auto mode.

### 7.3.6 Optional stop

In AUTO mode, the valid optional stop function is as follows:

Press key to enter optional stop and the indicator lights up.

The program will be "stopped" at command M01. Press $\square$ (1) key again to continue program execution.

### 7.4 Memorizing at power-down

### 7.4.1 Program interruption in non-DNC auto operation

Operation method 1 (Manual)

1. After power on, press conversion key $\rightarrow$ press letter "T"+letter"O" $\rightarrow$ up, down moving keys on pages"program content, edit" to the block where the execution stops last time.
2. Switch to the pages "coordinate \& program, machine zero".
3. Enter the next step after machine zero is performed.
4. Switch to manual or MDI mode. Locate to the block where it stops last time. (At this moment, it is necessary to confirm whether it is at state G40, G49, G54. Ensure that tools are in a safe range during positioning.)
5. Switch to manual mode, press conversion key. It prompts "Locate to the block where it stops last time. It will recover the mode before power-down (Y/N)".
6. Press $Y$ to recover the mode before power-down.
7. Switch to auto mode, press cycle start key to execute the block continuously from where it stops last time.

Operation method 2 (Auto)

1. After power on, press conversion key $\rightarrow$ press letter " $T$ "+letter" $O$ " $\rightarrow$ up, down moving keys on pages"program content, edit" to the block where the execution stops last time.
2. Switch to the pages "coordinate \& program, machine zero".
3. Perform machine zero operation.
4. After machine zero is performed, press conversion key. It prompts at the bottom of the screen: "Locate to the block automatically where it stops last time. It will recover the mode before power-down (Y/N)". Input $Y$ (Ensure that tools moving path is in a safe range at this moment.). Coordinates start move, it locates to the block where it stops last time, and recovers the mode before power-down.
5. Switch to auto mode, press cycle start key to execute the block continuously where it stops last time.

### 7.4.2 Interruption at power-down on DNC auto operation

Operation method (Auto)

1. Switch to "coordinate program, machine zero return" after power on.
2. Execute machine zero return.
3. After machine zero return is finished, press conversion key. It prompts at the bottom of the screen: "Locate to the block automatically where it stops last time. It will recover the mode before power-down ( $\mathrm{Y} / \mathrm{N}$ ) ". Input Y (Make sure tools moving path is in a safe range at this moment.). Coordinates start move, it locates to the block where it stops last time, and recovers the mode before power-down.
4. Switch to the highlighted block when DNC, CNC power down.
5. Search for the interrupted block in DNC transmission software, then press RESET key on panel to continue PC software transmission. Press cycle start key to continue execution.

## CHAPTER 8 MACHINE ZERO RETURN OPERATION

### 8.1 Machine Zero

The machine coordinate system is a basic coordinate system for CNC coordinate calculation. It is an inherent coordinate system of the machine. The origin of the machine coordinate system is called machine zero (or mechanical reference point). It is defined by the zero return switches fixed on the machine. Usually the switch is fixed on the positive max. Strokes of $\mathrm{X}, \mathrm{Y}$, $Z$ axes.

### 8.2Machine Zero Return Steps

1 Press ${ }_{2 \rightarrow 2}$ key, it enters the Machine zero mode, the bottom line of the screen page shows "REF", the figure is as follows:

key to select the machine zero of $X, Y$ or $Z$ axis
3 The machine moves along the machine zero direction, and returns to the machine zero via the deceleration signal, zero signal detection. And the axis stops with the machine zero finish indicator lighting up.

Machine zero finish indicators
Note1: If the machine zero is not fixed on the machine, machine zero operation $B / C / D$ is unallowed.

Note2: While the coordinate is moved out from the machine zero, the machine zero finish indicators go out.
Note3: After the machine zero operation, the cancellation of the tool length offset for the

CNC is set by the BIT7 of the bit parameter No. 22
Note4: See details in the 3rd part INSTALLATION AND CONNECTION for the parameters concerning with the machine zero.
Note 5: When machine zero return, bit parameter №011 ZNIK determines whether axis movement is locked automatically.
Note 6: Only machine zero D mode can be used for rotary axis.

## CHAPTER 9 DATA SETTING, BACKUP and RESTORE

### 9.1Data Setting

### 9.1.1 Switch setting

In SWITCH SETTING page, the ON-OFF state of PARM SWT (parameter switch), PROG SWT (program switch), AUTO SEG (auto sequence No.) can be displayed and set, the figure is as follows:

 SWITCH SETTING page

2
 key to move the cursor to the item to be set

3 Press
 and
 state, press $\square$ or
 the right to set the switch for ON.
Only the PARM SWT is set to ON, could the parameter be altered; so are PROG SWT and AUTO SEG

Note 1: When parameter switch is shifted from "off"to"on"for the first time, CNC alarm occurs. Press
 CANCEL
keys together to eliminate the alarm. Alarm will not occur when parameter switch is shifted again. For security, set parameter switch to "off" after parameter alteration is finished.
Note 2: When parameter switch is shifted from "off"to"on", CNC alarm occurs. Alarm will occur again when Cancel parameter switch is shifted from "on"to"off"for the first time. Press
 eliminate the alarm.

### 9.1.2 Graphic setting

 graphic parameter page.

| GRAPH SET |  | 00000 N 00000 |
| :---: | :---: | :---: |
| COOR OPT= | 0 0XY 1YX 2ZX 3XYZ 4YZ 5ZY | 6XZ 7XZY) |
| SCALE = | 100\% |  |
| CENTER = | 0.000 ( X axis value) |  |
| CENTER = | 0.000 (Y axis value) |  |
| CENTER = | 0.000 (Z axis value) |  |
| - X MAX $=$ | 120.000 |  |
| Y MAX. $=$ | 120.000 |  |
| 2 MAX . $=$ | 120.000 |  |
| X MIN. $=$ | -120.000 |  |
| Y MIN. = | -120.000 |  |
| Z MIN. = | -120.000 |  |
| REF |  | S0000 T00 H00 |

A: The way of setting graphic parameter

1. In MDI mode, press $\mathbb{\Delta}$ or key to move the cursor to the parameter to be set,
2. Input corresponding valus,

B: Significance of graphic parameter
Coordinate selection: Display view angle of the graphic path can be selected by setting different values. Corresponding coordinate for 0~7is as follows.

Scaling: Display the scaling of current graphic path.
Graphic center: Display the center of each axis.
Maximum, minimum: Set the maximum and minimum scope can be displayed by each axis.

C: Graphic track operation
Graphic track is as follows:

| 图形轨迹 | 00001 N00000 |
| :---: | :---: |
|  | （绝对坐标） |
|  | X 0.000 |
|  | $\mathrm{Y} \quad 0.000$ |
| $\sim$ | Z 0.000 |
| （ | 5 ：开始作图 |
| （－） | T ：停止作图 |
| Y | R ：清除轨迹 |
| $\uparrow$ | K ：切换视角 |
|  | J ：居中显示 |
| $\longrightarrow \mathrm{X}$ 纵向平移：0，横向平移：0，缩放：100\％ | MI：缩放轨迹 |
| 自动 单段 | S0000 T01 H00 |

Vertical move：Display upper and lower part of the graphic．
Horizontal move：Display right and left part of the graphic．
Scaling：Display scaling of current graphic．
Absolute coordinate：Display the absolute coordinate of the program．
S：Start drawing， S is highlighted by pressing S key．Display drawing track．
T ：Stop drawing， T is highlighted by pressing S key．It stops drawing．
R：Clear graphic track，clear graphic track displayed before．
K：Switch view angle，coordinate value can be switched between $0 \sim 7$ by pressing $K$ key each time．
$\mathrm{J}: \quad$ Display graphic in the center，that is，vertical move and horizontal move are 0.
I：Scale up the track，the graphic is scaled up 2 fold by pressing I key once．
M：Scale down the track，the graphic is scaled down 2 fold by pressing $M$ key once．

Graphic moving up，down，left ，right．

## 9．1．3 Parameter setting

By the parameter setting，the characteristics of the drive unit and machine can be adjusted．See Appendix 1 for their significance

the parameter page, the figure is as follows:

| BIT PARAMETER |  |  |  |  | 00000 N00000 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| NO. | DATA | NO. | DATA | NO. | DATA |
| 001 | 00000000 | 009 | 00011111 | 017 | 00101000 |
| 002 | 00000010 | 010 | 00011111 | 018 | 00000000 |
| 003 | 00000000 | 011 | 00000000 | 019 | 10000000 |
| 004 | 01000000 | 012 | 00010011 | 020 | 00000000 |
| 005 | 00010001 | 013 | 10000011 | 021 | 00000000 |
| 006 | 00000000 | 014 | 00011111 | 022 | 00000000 |
| 007 | 00000000 | 015 | 10000000 | 023 | 00000000 |
| 008 | 00011111 | 016 | 00000000 | 024 | 00000000 |
| **** **** **** ACS HWL $\quad * * * * * * * * * *$ bit4:1/0:Analog vol./switch ctrl spindle NO. 001 |  |  |  |  |  |
| AUTO | SBK |  |  |  | S0000 T00 H00 |

## A Alteration of the bit parameter

1 Byte alteration

1) Turn on the parameter switch
2) Enter the MDI mode
3) Move the cursor to the parameter No. to be set

Method 1:
 key to enter the page containing the
parameter to be set, press
 key to move the cursor to the No. of the parameter to be set;

4) Key in the new parameter value
5)

6) For security, the PARM SWT needs to be set to OFF after all parameters setting is finished

## Example:

Set the BIT5 (DECI) of the bit parameter No. 004 to 1, and the other bits unchanged.
Move the cursor to No.004, key in 01100000 by sequence in the prompt line, the figure is as follows:

| BIT PARAMETER |  |  |  |  | 00000 N00000 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| NO. | DATA | NO. | DATA | NO. | DATA |
| 001 | 00000000 | 009 | 00011111 | 017 | 00101000 |
| 002 | 00000010 | 010 | 00011111 | 018 | 00000000 |
| 003 | 00000000 | 011 | 00000000 | 019 | 10000000 |
| 004 | 00100000 | 012 | 00010011 | 020 | 00000000 |
| 005 | 00010001 | 013 | 10000011 | 021 | 00000000 |
| 006 | 00000000 | 014 | 00011111 | 022 | 00000000 |
| 007 | 00000000 | 015 | 10000000 | 023 | 00000000 |
| 008 | 00011111 | 016 | 00000000 | 024 | 00000000 |
| *** RDRN DECI *** PROD ******* SCW bit5:1/0:DEC signal is low/high level NO. $004=01100000$ |  |  |  |  |  |
|  |  |  |  |  |  |
| MDI |  |  |  |  | 000 T 00 H 00 |

| bit5:1/O:DEC signal is low/high level |  |  |  |  |  |
| NO. $004=$ |  |  |  |  |  |
| MDI |  |  |  | $S 0000$ T00 H00 |  |

2 Bit alteration

1) Turn on the parameter switch
2) Enter the MDI mode
3) Move the cursor to the No. of the parameter to be set

Method 1: Press
 key to enter the page of the parameter to be set, press $\downarrow$ or key to move the cursor to the No. of the parameter to be set

Method 2: Press address key
 key in parameter No., then press

4) Press and hold
 key for 2 seconds or press
$\square$ key to skip to a bit of the parameter, and the bit is backlighted. Press $\triangle$ or $\leftrightarrow$ key to move the cursor to the bit to be altered, then key in 0 or 1
5) After all parameters setting is finished, the PARM SWT needs to be set for OFF for security

Note: After entering a bit of the parameter, press and hold $\square$ key for 2 seconds or press OHENGE key, it may skip out of the bit and back to the parameter No.

## Example:

Set the BIT5 (DECI) of the bit parameter No. 004 to 1, and the other bits unchanged Move the cursor to "No.004" by the steps above, press and hold $\square$ key for 2 seconds or press ${ }^{\text {CHANGE }}$ key to skip to a bit of the parameter, the figure is as follows:

| BIT PARAMETER |  |  | 00000 N00000 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| NO. | DATA | NO. | DATA | NO. | DATA |

## B Alteration of the data parameter, pitch data

1 Data parameter alteration

1) Turn on the parameter switch;
2) Enter the MDI mode
3) Move the cursor to the No. of the parameter to be set
4) Key in the new parameter value
5) 

6) After all parameters setting is finished, the PARM SWT needs to be set to OFF for security

Example 1: Set the data parameter №059 to 4000.
Move the cursor to "№059" by the steps above, key in "4000" by sequence in the prompt line, the figure is as follows:

[^0]| DATA PARAMETER |  |  |  |  | $00000 \mathrm{N00000}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| No. | DATA | NO. | DATA | NO. | DATA |
| 049 | 1 | 057 | 1 | 065 | 100 |
| 050 | 1 | 058 | 1 | 066 | 100 |
| 051 | 1 | -059 | 4000 | 067 | 100 |
| 052 | 1 | -060 | 7600 | 068 | 100 |
| 053 | 1 | 061 | 7600 | 069 | 400 |
| 054 | 1 | 062 | 7600 | 070 | 8000 |
| 055 | 1 | 063 | 7600 | 071 | 50 |
| 056 | 1 | 064 | 100 | 072 | 100 |
| Max. speed of rapid locating in $\mathrm{X}(\mathrm{mm} / \mathrm{min})$ NO. 059 |  |  |  |  |  |
| MDI |  |  |  |  | S0000 T00 H00 |

Example 2: Set the $X$ axis value of the pitch data No. 000 to 12, set the value of $Z$ axis to 30 Move the cursor to pitch data No. 000 by the steps above, key in "X12" by sequence in the cue line, the figure is as follows:

| SCREN-PITCH PARAMETER |  |  |  |  |  |  | 00000 N00000 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| No. | X | Y | Z | C | NO. | X | Y | Z | C |

| MDI |  |  |  |  |  |  |  | T0 | H00 |

### 9.2 The Password Setting and Alteration

To prevent the part programs, CNC parameters from malignant alteration, this GSK980MD provides an authority setting function that is graded for 4 levels. By decending sequence, they are machine builder $\left(2^{\text {nd }}\right)$ level, equipment management $\left(3^{\text {rd }}\right)$ level, technician $\left(4^{\text {th }}\right)$ level, machining operation (5th) level

The $2^{\text {nd }}$ level: Modification of the CNC bit parameter, data parameter, pitch data, tool offset data, part program edit, PLC ladder transmission etc. are allowed

The $3^{\text {rd }}$ level: initial password 2345, the CNC bit parameter, data parameter, tool offset data, part program edit operations are allowed;

The $4^{\text {th }}$ level: initial password 1234, tool offset data (for tool setting), macro variables, part program edit operations are allowed; but the CNC bit parameter, data parameter, pitch data operations are unallowed.

The $5^{\text {th }}$ level: no password. Only the machine panel operation is allowed, and the operations of part program edit and selection, the alteration operations of CNC bit parameter, data parameter, pitch data, tool offset data are unallowed

| AUTH. OPERATION | $00000 \mathrm{N00000}$ |  |
| :---: | :---: | :---: |
| CURRENT LEVEL: 3 <br> SET LOWER LEVEL <br> INPUT PASSMORD: $\qquad$ UPDATE PASS. : $\qquad$ | Backup PAR. Resume PAR. <br> Resume PAR. 1 <br> Resume PAR. 2 <br> Resume PAR. 3 | (User)) <br> (User)) <br> (Test) <br> (Step) <br> (Servo) |
| Modify parameter and edit program |  |  |

After entering the authority setting page, the cursor locates at the "INPUT PASSWORD:"line. It
may press the $\square$ or key to move the cursor to the corresponding item．
－Press $\square$ key once，the cursor shifts a line upward．If the current cursor locates at the＂SET LOWER LEVEL＂line（1 ${ }^{\text {st }}$ line），press $\square$ key，the cursor shifts to the＂UPDATE PASS：＂line （end line）
－Press $\square$ key once，the cursor shifts a line upward．If the current cursor locates at the end line，by $\square$ 3 key once，the cursor moves to the 1 st line．

## 9．2．1 Entry of the operation level

1 After entering the PASSWORD SETTING page，move the cursor to the＂INPUT PASSWORD：＂line；

2 Key in the password（an＂＊＂sign added each time inputting a character）

Pres
Note The length of this GSK980MD system password corresponds to the operation level，which can＇t be added or decreased by user at will．

| Operation <br> level <br> 3rd | 5 bits | Initial <br> password <br> 12345 |
| :---: | :---: | :---: |
| 4th | 4 bits | 1234 |
| 5th | No | No |

Example：The current CNC level is the $4^{\text {th }}$ level，as the following page shows．The $3^{\text {rd }}$ level password of CNC is 12345 ，please alter the current level to the $3^{\text {rd }}$ level．

| AUTH．OPERATION | 00000 N 00000 |  |
| :---: | :---: | :---: |
| CURRENT LEVEL： 4 <br> SET LOWER LEVEL <br> INPUT PASSNORD：＊＊＊＊＊＊ UPDATE PASS．： | Backup PAR． Resume PAR． <br> Resume PAR． 1 <br> Resume PAR． 2 <br> Resume PAR． 3 | （User）） <br> （User）） <br> （Test） <br> （Step） <br> （Servo） |
| Can edit prog，input macro varkoffset |  |  |

Move the cursor to the "INPUT PASSWORD:"line, key in 12345, then press the
key, the CNC prompts "Modify parameter and edit program", "Password passed", and the current level is the $3^{\text {rd }}$ level. The page is as follows:

| AJTH. OPERATION | 00000 N 00000 |  |
| :---: | :---: | :---: |
| CURRENT LEVEL: 3 <br> SET LOWER LEVEL <br> INPUT PASSNORD: $\qquad$ <br> UPDATE PASS. : $\qquad$ | Backup PAR. Resume PAR. <br> Resume PAR. 1 <br> Resume PAR. 2 <br> Resume PAR. 3 | (User)) <br> (User)) <br> (Test) <br> (Step) <br> (Servo) |
| Modify parameter and edit program |  |  |

Note: When current operation authority is lower than or equal to the $3^{\text {rd }}$ level $\left(3^{\text {rd }}, 4^{\text {th }}, 5^{\text {th }}\right.$ level), the password level is not changed if repower the CNC system. If previous level is higher than the $3^{\text {rd }}$ level $\left(0,1^{\text {st }}\right.$, or $2^{\text {nd }}$ level), it defaults the $3^{\text {rd }}$ level.

### 9.2.2 Alteration of the password

Steps for password alteration:
1 After entering the PASSWORD SETTING page, enter the password by the methods in Section10.3.2;

2 Move the cursor to the"ALTER PASSWORD:"line;

3 Key in the new password, and press
 key
4 The CNC system prompts "PLEASE INPUT USER PASSWORD AGAIN", the page is as follows:

| AJTH. OPERATION | 00000 N 00000 |  |
| :---: | :---: | :---: |
| CURRENT LEVEL: 3 <br> SET LOWER LEVEL <br> INPUT PASSMORD: $\qquad$ <br> UPDATE PASS. : $\qquad$ | Backup PAR. Resume PAR. <br> Resume PAR. 1 <br> Resume PAR. 2 <br> Resume PAR. 3 | (User)) <br> (User)) <br> (Test) <br> (Step) <br> (Servo) |
| Modify parameter and edit program |  |  |

| AJTH. OPERATION | $00000 \mathrm{N00000}$ |  |
| :---: | :---: | :---: |
| CURRENT LEVEL: 3 <br> SET LOWER LEVEL <br> INPUT PASSNORD: $\qquad$ <br> UPDATE PASS. : $\qquad$ <br> PASSWORD UPDATED. | Backup PAR. Resume PAR. <br> Resume PAR. 1 <br> Resume PAR. 2 <br> Resume PAR. 3 | (User)) <br> (User)) <br> (Test) <br> (Step) <br> (Servo) |
| Modify parameter and edit program |  |  |
| MDI | S0 | T00 H00 |

6 If the two passwords input are not identical, CNC prompts "PASSWORD CHECKOUT ERROR.", the page is as follows:

| AJTH. OPERATION | 00000 N00000 |  |
| :---: | :---: | :---: |
| CURRENT LEVEL: 3 <br> SET LOWER LEVEL <br> INPUT PASSNORD: $\qquad$ <br> UPDATE PASS. : $\qquad$ <br> PASSNORD CHECKOUT ERROR. | Backup PAR. Resume PAR. <br> Resume PAR. 1 <br> Resume PAR. 2 <br> Resume PAR. 3 | (User)) <br> (User)) <br> (Test) <br> (Step) <br> (Servo) |
| Modify parameter and edit program |  |  |
| MDI | S0 | T00 H00 |

### 9.2.3 Lower level set

The demotion of the operation level is used to enter a lower level from a higher level, the steps are as follows:

1 After entering the PASSWORD SETTING page, key in the password by the method in Section 10.3.2

2 Move the cursor to the"SET LOWER LEVEL"line, if the current CNC operation is the $3^{\text {rd }}$ level, the page is as follows:

| ALTH. OPERATION | 00000 N00000 |  |
| :---: | :---: | :---: |
| CURRENT LEVEL: 3 <br> SET LOMER LEVEL <br> INPUT PASSMORD: $\qquad$ <br> UPDATE PASS. : $\qquad$ | Backup PAR. Resume PAR. <br> Resume PAR. 1 <br> Resume PAR. 2 <br> Resume PAR. 3 | (User)) <br> (User)) <br> (Test) <br> (Step) <br> (Servo) |
| Modify parameter and edit program |  |  |
| MDI | s | T00 H00 |

3
key, the CNC prompts "CURRENT LEVEL TO 4, OK? "; the page is as follows:

| AJTH. OPERATION | $00000 \mathrm{N00000}$ |  |
| :---: | :---: | :---: |
| CURRENT LEVEL: 3 <br> SET LOWER LEVEL <br> INPUT PASSWORD: $\qquad$ <br> UPDATE PASS. : $\qquad$ CURRENT LEVEL TO4, MAKE SURE? | Backup PAR. Resume PAR. Resume PAR. 1 Resume PAR. 2 Resume PAR. 3 | (User)) <br> (User)) <br> (Test) <br> (Step) <br> (Servo) |
| Modify parameter and edit program |  |  |
| MDI |  | T00 H00 |

Note If the current level is the $5^{\text {th }}$ level, the demotion operation is unallowed.

### 9.3 Data Restore and Backup

The user data (such as bit parameter and pitch data) can be backup (saved) and restored (read) in this GSK980MD system. It doesn't affect the part programs stored in the CNC system while backuping and restoring these data. The backup page is as follows:

key repeatedly, "PASSWORD SETTING" and "DATA BACKUP" pages can be switched.

| DATA BACKUP | $00000 \mathrm{N00000}$ |  |
| :---: | :---: | :---: |
| CURRENT LEVEL: 3 <br> SET LOWER LEVEL <br> INPUT PASSNORD: $\qquad$ <br> UPDATE PASS. : $\qquad$ | Backup PAR. Resume PAR. Resume PAR. 1 Resume PAR. 2 Resume PAR. 3 | (User) <br> (User) <br> (Test) <br> (Step) <br> (Servo) |
| PRESS[IN]+[P]TO CONFIRM (POWER ON) |  |  |
| MDI | S0 | T00 H00 |

- Turn on the parameter switch
 necessary) to enter PASSWORD SETTING page;
- Press CHANGE , and switch to the Data Backup page.
- Move the cursor to the desired item;
- Press | DiNPU |
| :--- |
| DATA | .

keys together.

Note Don't cut off the power in the backup and restore operation of the data, and no other operation is suggested to be performed before the aforesaid operation is prompted to be finished.

Example: to restore the CNC parameter to $1 \mu$ level servo standard parameter, the steps are as follows:

Turn on the parameter switch, and enter the Backup PAR. page of MDI mode, move the cursor to "Recover Default PAR. ( $1 \mu$ level)", as the following figure shows:

| DATA BACKIP | 00000 N 00000 |  |
| :---: | :---: | :---: |
| CURRENT LEVEL: 3 <br> SET LOWER LEVEL <br> INPUT PASSNORD: $\qquad$ UPDATE PASS. : $\qquad$ | Backup PAR. Resume PAR. Resume PAR. 1 Resume PAR. 2 - Resume PAR. 3 | (User) <br> (User) <br> (Test) <br> (Step) <br> (Servo) |
| SUCCEEDING IN RECOVERING SERVO PAR(POWER ON) |  |  |
| MDI | S0 | T00 H00 |

Press
$\square$ keys together, the CNC system prompts "SERVO PAR BACKUP RECOVERED (POWER ON )".

## CHAPTER 10 ADVANCE OPERATION

Advance operation interface of GSK980MDa, which is as follows, is started by connecting CNC to USB. In this interface, communication between CNC \& USB and system update operations can be done. Its transmission speed is much faster than traditional serial communication speed, greatly increases the efficiency of file transmission. More over, USB is easy to carry, to use and it supports hot plugging, plug and play at once.

### 10.1 Operation path

USB operation in 980MDa is searching and setting up destination list on $U$ disk with its number. Therefore, the system with different number is corresponding to different $U$ disk list in advance operation.

Example: If the number of system A is CT1010MDa, the list of advance operation on $U$ disk is as follows:

If the number of system $B$ is CT2138MDa, the list of advance operation on $U$ disk is as follows:

If the system has no number, the list of advance operation on U disk is as follows:

```
\squareu:
    \square\squaregsk980mda_backup
    Gys
```

Note: The number of the system can be found in version information page of diagnosis. The following contents are described by list of gsk980mda_backup.

## > Path explanations

| Path file folder |  | Explanation |  |  |
| :---: | :--- | :--- | :---: | :---: |
| user |  |  |  | Target position for parameter and PLC file <br> backup and restore |
| $\backslash$ | Target position for part program file backup <br> and restore |  |  |  |

> File specification

|  | File name | Expended <br> name | Remark |
| :--- | :--- | :--- | :--- |
| Parameter <br> file | Para1, Para2, <br> Para3 | . .par | Case sensitive |
| Part program | O0000~09999 | .CNC | Case sensitive |
| PLC file | plc ~ plc7 | .$l d x$ | Case sensitive |

> Operation authority

| Backup operation | Parameter | Authority level 3 (including level 3) |
| :---: | :---: | :---: |
|  | Part program | Authority level 3 (including level 3) |
|  | Ladder diagram | Authority level 3 (including level 3) |
| Restore operation | Parameter | ```Authority level 3 (including level 3)``` |
|  | Part program | Authority level 3 (including level 3) |
|  | Ladder diagram | Authority level 2 (including level 2) |

Note: Level 2 or above authority is needed for part program operation above number 9000.

### 10.2 Operation instructions

## > Key descriptions

Cursor moving: Press direction keys Menu selection: Press $\stackrel{\text { DATA }}{\text { INPT }}$ key to select the operation item which cursor is in.

Menu cancellation: Press ${ }^{\text {CANCE }}$ key to cancel the operation item which cursor is in.

Operation execution: Press OUTPUT key to execute all operation items selected in current column.
Operation confirmation: Execution needs to be confirmed, please press $\mathbb{Y}^{\text {a }}$ key to confirm or press
$\square$ key to cancel the execution.

## > Parameter restore and backup

Backup the parameter: Copy all parameter states and values to U:Igsk980MDa_backupluser\ of USB memory unit in the form of file Para1.par, Para2.par, Para3.par. If the above-mentioned file does not exist, set up a new one: If the file exists, this file will be overwritten by the new one.

Restore the parameter: Copy parameter files from USB memory unit U:Igsk980MDa_backupluserl back to the CNC system to restore the system parameter. Restore operation cannot be done if the above-mentioned path is moved or altered or irregular file name is renamed.

Note: Repower the CNC system after parameter load is successful.

## > Part program restore and backup

Backup the part parameter: Copy all part programs of current system to U:Igsk980MDa_backupluserlprog\ of USB memory unit in the form of file .CNC. If the above-mentioned file does not exist, set up a new one: If the file exists, this file will be overwritten by the new one.

Restore the part program: Copy all part programs from USB memory unit U:Igsk980MDa_backupluserlprog\ back to the CNC system to restore the part program. Restore operation cannot be done if the above-mentioned path is moved or altered or irregular file name is renamed.

## > Ladder diagram (PLC) restore and backup

The ladder diagram backup: Copy all ladder diagrams (.Idx file) of the current system to U:Igsk980MDa_backupluserl of USB memory unit. If the above-mentioned file does not exist, set up a new one: If the file exists, this file will be overwritten by the new one.

Restore the ladder diagram: Copy parameter files from USB memory unit U:Igsk980MDa_backupluserl back to the CNC system to restore the ladder diagram. Restore operation cannot be done if the above-mentioned path is moved or altered or irregular file name is renamed.
Note: Repower the CNC system after the ladder diagram restore is successful.

### 10.3 Attentions

> Notice: If a file or list on target path has the same name as the one will be copied, it will be overwritten and replaced by the system automatically. Therefore, to prevent the file or list from overwriting or replacing, please copy and save it separately.
> It forbids doing any other operation in advance operation. Once operation is performed, it can not be interrupted until it is finished.
$>$ If the file to be saved or restored is large, operation time will be long. Please wait.
> Pull out USB if abnormal conditions occur, then connect it again.

## CHAPTER 11 FLASH OPERATION

### 11.1. File list

In edit or MDI mode, press $\square$ key to identify $U$ disk.
If identification is unsuccessful, it prompts: "Fail to connect $U$ disk". If identification is successful, the following file list will be displayed.

Special explanation:
The list information of disk CNC is displayed at the page left and list information of disk USB is displayed at the page right. The display column will not display any information if $U$ disk is not detected. Character entry box, file attributes information and user operation prompts are displayed at the bottom of the page.

1. Current list page only display the list information of the currently opened folder.
2. U disk can be identified in edit or MDI mode.
3. It not support Chinese complex characters.
4. It not support Chinese long file name, only the first three characters .+" $\sim 1$ "of this file name can be displayed.
5. Non-CNC file of $C$ disk and $U$ disk is displayed.

Note: The file name, which consists of " 0 " + " 4 digits" + ". CNC ", is considered to be CNC format file.

### 11.2. Introduction of general file operation function

### 11.2.1 Open and close file folder

Move the cursor to the folder will be opened.

Press $\stackrel{\square}{\square}$ key to open the folder. The list which the file locates is displayed in the first line (long list is scrolling display)

### 11.2.2 Copy the file by one key(current list in C disk $\longleftrightarrow \rightarrow$ current list in U disk)

(1) Select CNC file, press

| FILE LIST |  | $00000 \mathrm{N00000}$ |
| :---: | :---: | :---: |

| EDIT |  | S0000 T00 H00 |

If program search is successful after input "O5", the cursor moves to target program. If this program can not be searched, "the file dose not exist" will be prompted at message column.

### 11.2.4 Open CNC file

1. In"EDIT"and"AUTO"mode, select the CNC format file when there is no program execution.

2. Press

E(1)B key to open the file. Current page is switched to [program content] page.

| PRG CONTENT | SEG1 | COL:1 | U:/00006. CNC |
| :---: | :---: | :---: | :---: |
| 00006 (00006) ; |  |  |  |
| G54 G90 G0 X0 Y0 Z0; |  |  |  |
| $643 \mathrm{H1}$; |  |  |  |
| g81 r-2 z-10 f150; |  |  |  |
| G44 H2; |  |  |  |
| Y30; |  |  |  |
| 380; |  |  |  |
| 649; |  |  |  |
| X0 Y0 Z0; |  |  |  |
| M30; |  |  |  |
| EDIT |  |  | . 50000 T 00 |

Special explanations:

1. The program above number 9000 can not be opened with authority level 3 or under

## level 3.

2. The program file can not be opened with authority level 5 .

Attentions:

1. In "program content", it is not allowed to do any operation on U disk. These operations are: setting-up, duplication, rename, deletion, editing, save, etc.. Process and check operations can be done for programs on $U$ disk in page"program content".
2. The called subprogram in auto-run should in a same level of list with main program.
3. Pull out $U$ disk when it is open, system alarm occurs" $U$ disk is not connected". At this time, plug in $U$ disk again, press $\begin{aligned} & \text { OHANGE } \\ & \text { key to detect } U \text { disk in MDI }\end{aligned}$ mode, or press REBET CANCB keys to clear the alarm.

## VOLUME III INSTALLATION

## CHAPTER 1 INSTALLATION LAYOUT

### 1.1 GSK980MDa Connection

### 1.1.1 GSK980MDa back cover interface layout

Fig 1-1 GSK980MDa back cover interface layout

### 1.1.2 Interface explanation

- Power box: GSK-PB2,for +5V, +24V, +12V, -12V, GND power supply
- CN11: $X$ axis, 15 -core DB female socket,for connecting $X$ axis drive unit
- CN12: $Y$ axis, 15-core DB female socket,for connecting $Y$ axis drive unit
- CN13: $Z$ axis, 15 -core DB female socket,for connecting $Z$ axis drive unit
- CN14: 4th axis, 15-core DB female soket,for connecting 4th axis drive unit
- CN21: coder, 15-core DB female socket,for connecting Encoderd
- CN51: inverter, 9-core DB male socket,for connecting pc RS232 interface
- CN15: 5th axis\&spindle port, 25-core DB male socket,for connecting inverter \& 5th axis
- CN31: handwheel, 26 -core 3 line famele socket,for connecting handwheel;
- CN62: ouput, 44-core 3 lines famele socket, for sending the signal of CNC to machine
- CN61:input, 44-core 3 line male socket, for sending the signal of machine to CNC

### 1.2 GSK980MDa Installation

1.2.1 GSK980MDa external dimensions

### 1.2.2 Installation conditions of the cabinet

- The dust, cooling liquid and organic resolution should be effectively prevented from entering the cabinet;
- The designed distance between the CNC back cover and the cabinet should be not less than 20 cm , the inside and outside temperature difference of the cabinet should be no les than $10^{\circ} \mathrm{C}$ temperature rises when the cabinet inside temperature rises;
- Fans should be fixed in the cabinet to ventilate it;
- The panel should be installed in a place where the coolant can't splash;
- The external electrical interference should be taken into consideration in cabinet design to prevent it from transferring to CNC system.

### 1.2.3 Protection methods against interference

In order to ensure the CNC stable working, the anti-interference technology such as space electromagnetic radiation shielding, impact current absorbing, power mixed wave filtering are employed in CNC design. And the following measures are necessary during CNC connection:

1. Make CNC far from the interference devices (inverter, AC contactor, static generator, high-pressure generator and powered sectional devices etc.);
2. To supply the CNC via an isolation transformer, the machine with the CNC
should be grounded, the CNC and drive unit should be connected with independent grounding wires at the grounding point;
3. To supress interference: connect parallel RC circuit at both ends of AC coil (Fig. 1-4), RC circuit should approach to inductive loading as close as possible; reversely connect parallel freewheeling diode at both ends of DC coil (Fig. 1-5); connect parallel surge absorber at the ends of AC motor coil (Fig. 1-6);

Fig.1-6
4. To employ with twisted shield cable or shield cable for the leadout cable of CNC, the cable shield tier is grounded by single end at CNC side, signal cable should be as short as possible;
5. In order to decrease the mutual interference between CNC cables or CNC cables with strong-power cables,the wiring should comply to the following principles:

| Group | Cable type | Wiring requirement |
| :---: | :---: | :---: |
| A | AC power line | Tie up A group cables with a clearance at least 10 cm from that of B, C groups, or shield A group cables from electromagnetism |
|  | AC coil |  |
|  | AC contactor |  |
| B | DC coil (24VDC) | Tie up B and A group cables separately or shield $B$ group cables; and the further $B$ group cables are from that of $C$ group, the better it is |
|  | DC relay (24VDC) |  |
|  | Cables between CNC and strong-power cabinet |  |
|  | Cables between CNC and machine |  |
| C | Cables between CNC and servo drive unit | Tie up C and A group cables separately, or shield C group cables; and the cable distance between C group and B group is at least 10 cm with twisted pair cable applied. |
|  | Position feedback cable |  |
|  | Position encoder cable |  |
|  | MPG cable |  |
|  | Other cables for shield |  |

## CHAPTER 2 DEFINITION\&CONNECTION OF INTERFACE SIGNALS

### 2.1 Connection to Drive unit

### 2.1.1 Drive interface definition

1: CPn+
2: DIRn+
3: PCn
4: +24V
5: ALMn
6: SETn
7: ENn
8: RDYn/ZSDn

Fig.2-1 CN11, CN12, CN13 interface (DB15 female)

| Signal | Explanation |
| :---: | :---: |
| $\mathrm{CPn}+$, CPn- | Command pulse signal |
| DIRn+, DIRn- | Command direction sigal |
| PCn | Zero signal |
| ALMn | Drive unit alarm signal |
| ENn | Axis enable signal |
| SETn | Pusle disable signal |

### 2.1.2 Command pulse and direction signals

nCP+, nCP- are command pulse signals, nDIR+, nDIR- are command direction signals. These two group signals are both difference output (AM26LS31), the interior circuit for them is shown in Fig. 2-2.

Fig. 2-2 Interior circuit of command pulse and direction signals

### 2.1.3 Drive unit alarm signal

The low or high level of the drive unit alarm level is set by the CNC bit parameter No. 009 BIT0~ BIT4, whose interior circuit is shown in Fig. 2-3:

Fig.2-3 interior circuit of drive unit alarm signal

This input circuit requires that the drive unit transmits signal by the following types in Fig. 2-4:

Fig.2-4 Signal types of drive unit

### 2.1.4 Axis enable signal ENn

nEN signal output is valid as CNC works normally ( nEN signal to 0 V ); when the drive unit alarm or emergency alarm occurs, CNC cuts off nEN signal output (nEN signal toOV off). The interior interface circuit is shown in Fig.2-5:

Fig.2-5 interior interface circuit for axis enable signal

### 2.1.5 Pulse disable signal SETn

nSET signal is used to control servo input disable which can enhance the anti-disturbance capability between CNC and drive unit. This signal is at low level if there is pulse output from CNC, high resistance if not. The interior interface circuit of it is shown in Fig. 2-6:

Fig.2-6 Interior interface circuit for pulse disable signal

### 2.1.6 Zero signal nPC

The one-rotation or approach switch signal is taken as zero signal for machine zero return. Its interior connection circuit is shown in Fig.2-7.

Fig.2-7 Zero signal circuit
Note: nPC signal uses +24V level.
a) The connection for NPN Hall elements taken as both deceleration signal and zero signal is shown in Fig. 2-8:

Fig. 2-8 Connection using NPN Hall elements
b) The connection for PNP Hall elements taken as both deceleration signal and zero signal is shown in Fig. 2-9:

Fig 2-9 Connection using PNP Hall elements

### 2.1.7 Connection to drive unit

The connection of GSK 980MDa to GSK drive unit is shown in Fig. 2-10:

Fig.2-24 CN31 handwheel interface (3-1ine DB26 male socket)

### 2.5.2 Signal explanation

"HA+", "HA-", "HB+", "HB-" are the input singals of handwheel A and B phases. Its interior connection circuit is shown in Fig. 2-25:

Fig.2-25 Handwheel signal circuit
The connection of GSK980MDa to handwheel is shown in Fig. 2-26:

Fig.2-26 Connection of GSK980MDa to handwheel

### 2.6 Connection of GSK980MDa to PC

### 2.6.1 Communication interface definition

| $\begin{array}{ll} \text { 1: } & \\ \text { 2: } & \text { 3XD } \\ \text { 3: } & \text { TXD } \\ \text { 4: } & \\ \text { 5: } & \text { GND } \end{array}$ | $\begin{aligned} & \text { 6: } \\ & \text { 7: } \\ & \text { 8: } \\ & 9: \end{aligned}$ | Signal | Explanation |
| :---: | :---: | :---: | :---: |
|  |  | RXD | For date reception |
|  |  | TXD | For date transmiting |
|  |  | GND | For signal grounding |

Fig.2-27 CN51 communication interface
(DB9 female socket)

### 2.6.2 Communication interface connection

The communication between GSK980MDa and PC can be done via RS232 interface (GSK980MDa communication software needed), The connection of them is shown in Fig.2-28

Fig.2-28 Connection of GSK980MDa to PC

The communication of a GSK980MDa to another GSK980MDa can be made via their CN51 interfaces, and the connection of them is shown in Fig.2-29:

| GSK9 | Da (CN | GSK9 | UDa (CN5 |
| :---: | :---: | :---: | :---: |
| 3 | TXD | 2 | RXD |
| 2 | RXD | 3 | TXD |
| 5 | GND | 5 | GND |
|  | shell |  | al shell |

Fig.2-29 Communication connection of GSK980MDa to GSK980MDa

### 2.7 Connection of Power Interface

GSK-PB2 power box is applied in this GSK980MDa, which involves 4 groups of voltage: +5 V (3A) , +12 V 1 A ) , $-12 \mathrm{~V}(0.5 \mathrm{~A}),+24 \mathrm{~V}(0.5 \mathrm{~A})$, and its commom terminal is $\mathrm{COM}(0 \mathrm{~V})$. The connection of GSK-PB2 power box to GSK980MDa CN1 interface has been done for its delivery from factory, and the user only need to connect it to a 220V AC power in using:

The interface definition of GSK980MDa CN1 is shown below:

Fig.2-30

### 2.8 I/O Interface Definition:

CN61: 44-core (3-line) male socket

| NO. | Address | NO. | Address | NO. | Address | NO. | Address |

| 11 | Y1.2 | 22 | +24V | 33 | Y2.4 | 44 | Y3.7 |

Note 1: The I/O function of GSK980MDa drilling and milling CNC is defined by ladder diagram;
Note 2:If output function is valid, the output signal is on to 0 V . If output function is invalid, the output signal is cut off by high impendance;
Note 3: If input function is valid, the input signal is on to 24 V . If input function is invalid, the input signal is cut off with it;
Note 4: The effectiveness of $+24 \mathrm{~V}, 0 \mathrm{~V}$ is equal to GSK980MD power box terminals that have the same name; Note 5: XDEC, YDEC, ZDEC, DEC4, DEC5, ESP, SKIP are fixed signals that can't be altered.

### 2.8.1 Input Signal

Input signal means the signal from machine to CNC, when this signal is on with +24 V , the input is valid; when it is off with +24 V , the input is invalid. The contact point of input signal at machine side should meet the following conditions:

The capacity of the contact point: DC30V, 16mA above
Leakage current between contact points in open circuit: 1 mA below
Voltage drop between contact points in closed circuit: 2 V below (current 8.5 mA , including cable voltage drop)

There are two external input types for input signals: one type is input by trigger point switch whose signals are from keys, stroke switch and contacts of relay at machine side, as is shown in Fig 2-31:

Fig.2-31
The other type is input by switch with no contacts (transistor), as is shown in Fig. 2-32, 2-33

Fig.2-32 Connection of NPN

Fig.2-33 Connection of PNP

### 2.8.2 Output signal

The output signal is used for the machne relay and indicator, if it is on with 0 V , the output function is valid; if it is off with 0 V , the output function is invalid. There are total 36 digital volume outputs in I/O interface that they all have the same structure as is shown in Fig.2-34:

Fig.2-34 Circuit for digital volume output module
The logic signal OUTx output from the main board is sent to the input terminal of inverter (ULN2803) via a connector. And there are 2 output types for nOUTx: output with OV, or high impedance. Its typical application is shown in follows:

- To drive LED

A serial resistance is needed to limit the current (usually 10 mA ) that goes through the LED by using ULN2803 output to drive LED, which is shown in Fig.2-35

Fig.2-35

- To drive filament indicator

An external preheat resistance is needed to decrease the current impact at power on by using ULN2803 output to drive filament indicator, and this resistance value should be within a range that the indicator cann't light up. It is shown in Fig.2-36:

Fig. 2-36

- To drive inductive load (relay etc.)

To use ULN2803 output to drive an inductive load, it requires to connect a freewheeling diode near the coil to protect output circuit and deduce interference. It is shown in Fig.2-37:

Fig.2-37

### 2.9 Machine Zero

- Relative signal

| DECX | X axis deceleration signal | PCX | X axis zero signal |
| :---: | :---: | :---: | :---: |
| DECY | Y axis deceleration signal | PCY | Y axis zero signal |
| DECZ | Z axis deceleration signal | PCZ | $Z$ axis zero signal |
| DEC4 | $4^{\text {th }}$ axis deceleration signal | PC4 | $4^{\text {th }}$ axis zero signal |
| DEC5 | $5^{\text {th }}$ axis deceleration signal | PC5 | $5^{\text {th }}$ axis zero signal |

- CNC diagnosis

- Bit parameter

$\mathrm{DECl}=1$ : Deceleration signal is on with 24 V for deceleration when machine zero return is performed
$=0$ : Deceleration signal is off 24 V for deceleration when machine zero return is performed

$=0$ : Y axis machine zero return type B .
$Z M Z=1: Z$ axis machine zero return type $C$;
$=0: Z$ axis machine zero return type $B$.
ZM4 =1: 4th axis machine zero return type C;
$=0$ : 4th axis machine zero return type B.
ZM5 =1: 5th axis machine zero return type C;
$=0$ : 5th axis machine zero return type B.

ZCX =1: The deceleration signal (DECX ) and one-rotation signal (PCX) of $X$ axis are in parallel connection during machine zero return ( a proximity switch acting as both the deceleration signal and zero signal );
=0: The deceleration signal ( DECX ) and one-rotation signal ( PCX ) of $X$ axis are connected independently during machine zero return ( the indepent deceleration signal and zero signal are required).

ZCY =1: The deceleration signal ( DECY ) and one-rotation signal ( PCY ) of Y axis are in parallel connection during machine zero return ( a proximity switch acting as both the deceleration signal and zero signal );
$=0$ : The deceleration signal (DECY) and one-rotation signal (PCY) of Y axis are connected independently during machine zero return (the indepent deceleration signal and zero signal are required).

ZCZ =1: The deceleration signal (DECZ ) and one-rotation signal ( $P C Z$ ) of $Z$ axis are in parallel connection during machine zero return (a proximity switch acting as both the deceleration signal and zero signal );
=0: The deceleration signal (DECZ ) and one-rotation signal (PCZ ) of $Z$ axis are connected independently during machine zero return ( the indepent deceleration signal and zero signal are required) .

ZC4 =1: The deceleration signal (DEC4) and one-rotation signal (PC4 ) of 4th axis are in parallel connection during machine zero return ( a proximity switch acting as both the deceleration signal and zero signal );
=0: The deceleration signal ( DEC4 ) and one-rotation signal ( PC4 )of 4th axis are connected independently during machine zero return ( the indepent deceleration signal and zero signal are required).

ZC5 =1: The deceleration signal (DEC5 ) and one-rotation signal (PC5 ) of 5th axis are in parallel connection during machine zero return ( an proximity switch acting as both the deceleration signal and zero signal );
=0: The deceleration signal ( DEC5 ) and one-rotation signal ( PCZ ) of 5th axis are connected
independently during machine zero return ( the indepent deceleration signal and zero signal are required) .

ZNLK =1: The direction keys are locked as machine zero return is performed,by pressing the direction key once, it moves to the machine zero automatically and stops,By pressing the

$\mathscr{A}$ key at the machine zero return, the motion stops immediately;
$=0$ : The direction keys are not locked as machine zero return is performed, but the direction keys should be pressed and held on

=0: Manual rapid traverse invalid prior to machine zero return.

ZRSZ, ZRSX, ZRSY, ZRS4, ZRS5 =1: To select machine zero return type B, C, which have machine zero, it needs to detect deceleration and zero signals in machine zero return;
$=0$ : To select machine zero return type $A$, which has no machine zero, it does not detect deceleration and zero signals in machine zero return.

MZRX, MZRZ, MZRY, MZR4, MZR5 =1: The direction of zero return is negative for $X, Z, Y, 4^{\text {th }}, 5^{\text {th }}$ axes;
$=0$ : The direction of zero return is positive for $X, Z, Y, 4^{\text {th }}, 5^{\text {th }}$ axes

- Signal connection

The interior wiring circuit of deceleration signal is shown in Fig.2-37

Fig.2-37

- achine zero return type B by regarding servo motor one-rotation signal as zero signal (1)Its sketch map is shown in follows:

(2) The circuit of deceleration signal (for three axes)

Fig.2-40
(3) Action time sequence of machine zero return

When $\mathrm{ZMn}\left(\mathrm{n}\right.$ is $\mathrm{X}, \mathrm{Y}, \mathrm{Z}, 4^{\text {th }}, 5^{\text {th }}$ axis) of the bit parameter No.006, $\mathrm{ZCn}(\mathrm{n}=\mathrm{X}, \mathrm{Y}, \mathrm{Z}, 4 \mathrm{th}, 5$ th) of bit parameter No. 007 and the BIT5 (DECI) of the bit parameter No. 004 are all set to 0 , the deceleration signal low level is valid. The action time sequence of machine zero return is shown in follows

Fig.2-41
(4)Machine zero return process

A: Select machine zero return mode, press the manual positive or negative feed key(machine zero return direction is set by bit parameter No.022), the corresponding axis moves to the machine zero by a rapid traverse speed. As the axis press down the deceleration switch to cut off deceleration signal, the feed slows down immediately, and it continues to run in a fixed low speed.
B : When the deceleration switch is released, the deceleration signal contact point is closed again. And CNC begins to detect the encoder one-rotation signal, if the signal level changes, the motion will be stoped. And the corresponding zero indicator on the operator panel lights up for machine zero return completion

- Machine zero return type $B$ as an proximity switch is taken as both deceleration and zero signals
(1) Its sketch map is shown in follows:

Fig.2-42
(2) Wiring of the deceleration signal

See details in Section 2.1.6 of this chapter
(3) Action time sequence of machine zero return

When ZMn ( n is $\mathrm{X}, \mathrm{Y}, \mathrm{Z}, 4^{\text {th }}, 5^{\text {th }}$ axis ) of the bit parameter No. 006 and the BIT5 (DECI) of the bit parameter No. 004 are all set to $0, Z C n\left(n\right.$ is $X, Y, Z, 4^{\text {th }}, 5^{\text {th }}$ axis ) of the bit parameter No. 007 is set to 1 , the deceleration signal low level is valid. The action time sequence of zero return is shown in follows:

Fig.2-43 the action time sequence of zero return
(4) Machine zero returns process

A: Select the Machine Zero mode, press manual positive or negative (zero return direction set by bit parameter No.183) feed key, the corresponding axis will move to the zero at a traverse speed.

B: As the approach switch touches the tongue for the first time, the deceleration signal is valid and it slows down immediately to run in a low speed.

C: As the approach switch detaches the tongue, the deceleration signal is invalid, it moves at a fixed low speed after deceleration and starts to detect zero signal (PC).

D: As the approach switch touches the tongue for the second time, the zero signal is valid and the movement stops. The indicator for zero return on the panel lights up.

- Machine zero return type $\mathbf{C}$ as servo motor one-rotation signal taken as zero signal
(1) Its sketch map is shown below:

(2) Circuit of the deceleration signal

Fig.2-45
(3) Action time sequence of machine zero return

When ZMn ( n is $X, Y, Z, 4^{\text {th }}, 5^{\text {th }}$ axis) of the bit parameter No. 006 are all set for $1, \mathrm{ZCn}$ ( n is $\mathrm{X}, \mathrm{Y}, \mathrm{Z}, 4^{\text {th }}, 5^{\text {th }}$ axis) of the bit parameter No. 007 are all set for 0 , the BIT5 (DECI) of the bit parameter No. 004 is set for 0 , and the deceleration signal low level is valid. The action time sequence of machine zero return is shown in follows

Fig.2-46
(4) Machine zero returns process

A: Select the Machine Zero mode, press manual positive or negative (zero return direction set by bit parameter №022) feed key, the corresponding axis will move to the machine zero at a traverse speed. Then it touches the tongue and presses down the deceleration switch, and moves forward. When the tongue detaches the deceleration switch, the axis slows down to zero, then moves reversely and accelerates to a fixed low speed for continuous moving
B: As the tongue touches the deceleration switch for the second time, it moves on till the tongue detaches the deceleration switch. And it begins to detect the zero signals. If the zero signal level changes, the movement stops. Then zero return indicator of the corresponding axis on the panel lights up and machine zero operation is finished.

## - Machine zero return type C as an proximity switch is taken as both deceleration and zero signals

(1) Its sketch map is shown below:

Fig.2-47
(2) Circuit of the deceleration signal

See details in Section 2.1.6 of this chapter
(3) Action time sequence of machine zero return

When $Z M n$ ( $n$ is $X, Y, Z, 4^{\text {th }}, 5^{\text {th }}$ axis) of the bit parameter No. 006 and $Z C n\left(n\right.$ is $X, Y, Z, 4^{\text {th }}, 5^{\text {th }}$ axis) of the bit parameter No. 007 are all set to 1, the BIT5 (DECI) of the bit parameter No. 004 is set to 0, the deceleration signal low level is valid. The action time sequence of machine zero return is shown in follows:

Fig.2-48
(4) Machine zero returns process

A: Select the Machine Zero mode, press manual positive or negative (zero return direction is set by bit parameter No.183) feed key, the corresponding axis will move to the machine zero at a traverse speed. Then it touches the tongue and presses down the deceleration switch, and moves forward. When the tongue detaches the deceleration switch, the axis slows down to zero speed, then moves reversely and accelerates to a fixed low speed for continuous moving
B: As the tongue touches the deceleration switch for the second time, it begins to detect the zero signal. It moves on till the tongue detaches the deceleration switch, the movement stops immediately. Then zero return indicator of the corresponding axis on the panel lights up and machine zero return operation is finished.

## CHAPTER 3 PARAMETER

In this chapter the CNC bit and data parameters are introduced. Various functions can be set by these parameters.

### 3.1 Parameter Description (by sequence)

### 3.1.1 Bit parameter

The expression of bit parameter is shown in follows:

Parameter

NO.

| 0 | 0 | 1 |
| :--- | :--- | :--- |$\quad$| $* * *$ | ${ }^{* * *}$ | ${ }^{* * *}$ | ACS | HWL | ${ }^{* * *}$ | ${ }^{* * *}$ | ${ }^{* * *}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

ACS =1: Analog voltage control of spindle speed;
$=0$ : Switching control of spindle speed.
HWL =1: MPG mode;
=0: Step mode.

| 0 | 0 | 2 |
| :--- | :--- | :--- |$\quad$| $* * *$ | ${ }^{* * *}$ | ${ }^{* * *}$ | LIFJ | MDITL | LIFC | NRC | TLIF |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

=0: Tool life management group skip invalid.
MDITL =1: Tool life management valid in MDI mode;
$=0$ : Tool life management invalid in MDI mode.
LIFC =1: Tool life counting type 2, by times;
$=0$ : Tool life counting type 1 , by times.
NRC =1: Tool nose radius compensation valid;
$=0$ : Tool nose radius compensation invalid.
TLIF =1: Tool life management valid;
$=0$ : Tool life management invalid.

| 0 | 0 | 3 |
| :--- | :--- | :--- |

PCOMP =1: Screw-pitch error compensation valid;
=0: Screw-pitch error compensation invalid.
$D / R \quad=1$ : Tool offset $D$ is diameter value;
$=0$ : Tool offset $D$ is radius value.

| 0 | 0 | 4 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |$\quad$| $* * *$ | RDRN | DECI | ${ }^{* * *}$ | PROD |
| :--- | :--- | :--- | :--- | :--- |
|  | ${ }^{* * *}$ | ${ }^{* * *}$ | SCW |  |

RDRN =1: In G00 dry run mode, speed=feedrate $\times$ speed of dry run;
=0: G00 speed $=$ rapid override $\times$ rapid tranverse speed.
$\mathrm{DECI}=1$ : Deceleration signal high level for machine zero return;
$=0$ : Deceleration signal low level for machine zero return.

PROD =1: Relative coordinate displayed in POSITION page is programming position;
$=0$ : Relative coordinate displayed in POSITION page involving tool compensation.
SCW =1: Inch output(inch system)valid after repower;
=0: Metric output(metric system)valid after repower
The functions of metric and inch system
There are two kinds of input and output units for CNC numerical control system: metric unit, millimeter (mm) and English unit (inch).

Output increement unit is set by Bit0 (SCW) of bit parameter №004 in GSK980MDa system. SCW=0 indicates that minimum command increment, parameter and screw-pitch values are in metric units; SCW=1 indicates that minimum command increment, parameter and screw-pitch values are in inches units. The setting of this parameter depends on machine tool.

G code: By selecting G20/G21 code, it is able to set whether minimum input increment values are in inch or in metric. Executing G21 indicates that minimum input increment values are in metric; and executing G20 indicates that values are in inch,

| 0 | 0 | 5 |
| :--- | :--- | :--- |$\quad$| $* * *$ | ${ }^{* * *}$ | SMAL | M30 | ${ }^{* * *}$ | ${ }^{* * *}$ | PPD | PCMD |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

SMAL =1: Spindle manual gear shift for $S$ command;
=0: Spindle auto gear shift for S command.
M30 =1: Cursor returns to beginning after M30 execution;
$=0$ : Cursor not to beginning after M30 execution.
PPD =1: Relative coordinate set by G92;
=0: Relative coordinate not set by G92.
PCMD =1: Axial output wave form is pulse;
=0: Axial output wave form is square.

Square output, max. output frequency 266KPPS

Pulse output, max. output frequency 266KPPS, Pulse width $1 \mu \mathrm{~s}$.

| 0 | 0 | 7 |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| AVGL | ${ }^{* * *}$ | SMZ | ZC5 | ZC4 | ZCZ | ZCY | ZCX |

On the condition that blocks smoothing transition is valid, more smooth velocity link and better machining quality will be obtained during the path transition from line to line or from line to arc by properly changing the linear feedrate.

So the actual output speed may be different to the programming speed when using this function. And it may also differ as regard to the linear segment with the same programming speed. The deviation is not more than $15 \mathrm{~mm} / \mathrm{min}$ between the actual output speed and the programming speed on the condition that the programming speed $F$ is less than $1200 \mathrm{~mm} / \mathrm{min}$

AVGL =1: When SMZ=0 linear smoothing is valid, i.e. smoothing transition function is valid; $=0$ : Linear smoothing transition function is invalid.

SMZ =1: To execute next block till all moving blocks executed;
$=0$ : For smooth transition between blocks.

ZC5 =1: Deceleration signal (DEC5)and one-rotation signal (PC5) of $5^{\text {th }}$ axis are in parallel connection(a proximity switch taken as both deceleration signal and zero signal) during machine zero return;
$=0$ : Deceleration signal (DEC5) and one-rotation signal (PC5) of $5^{\text {th }}$ axis are connected independently (independent deceleration signal and zero signal are required) during machine zero return.

ZC4 =1: Deceleration signal (DEC4)and one-rotation signal (PC4) of 4th axis are in parallel connection (a proximity switch taken as both deceleration signal and zero signal) during machine zero return;
=0: Deceleration signal (DEC4) and one-rotation signal (PC4) of 4th axis are connected independently (independent deceleration signal and zero signal are required) during machine zero return.

ZCZ =1: Deceleration signal (DECZ) and one-rotation signal (PCZ) of $Z$ axis are in parallel connection a proximity switch taken as both deceleration signal and zero signal) during machine zero return;
$=0$ : Deceleration signal (DECZ) and one-rotation signal (PCZ) of $Z$ axis are connected independently (independent deceleration signal and zero signal are required) during machine zero return.

ZCY =1: Deceleration signal (DECY) and one-rotation signal (PCY) of $Y$ axis are in parallel connection a proximity switch taken as both deceleration signal and zero signal) during machine zero return;
=0: Deceleration signal (DECY) and one-rotation signal (PCY) of Y axis are connected independently (independent deceleration signal and zero signal are required) during machine zero return.

ZCX =1: Deceleration signal (DECX) and one-rotation signal (PCX) of $X$ axis are in parallel connection a proximity switch taken as both deceleration signal and zero signal) during
machine zero return;
=0: Deceleration signal (DECX) and one-rotation signal (PCX) of $X$ axis are connected independently (independent deceleration signal and zero signal are required) during machine zero return.

| 1 | 7 | 8 |
| :--- | :--- | :--- |$\quad$|  | G110,G111,G134,G135 |
| :--- | :--- | Lead of helical tool infeed

Setting range: $0 \sim 999999$ (unit 0.001 mm )
If setting value is less than 10, helical feeding is invalid for rough milling command G110, G111, G134, G135, and it feeds by linear type.

If setting value is more than or equal to 10 , it feeds by helical type for rough milling command G110, G111, G134, G135.

Rough milling command (G110,G111,134,G135) helical feed function:
Namely, for Z axis depth cutting of rough milling command G110, G111, 134, G135, the tool feeds not by linear type, but by helical type. So the workpiece with no groove may be rough milled directedly.

Note 1 when the $Z$ axis cutting depth is less than $10 \mu m$ each time, the helical feeding is invalid.
Note 2 when the tool radius is less than 1 mm , the helical feeding is also invalid.
The helical feeding path is shown in follows:

## CHAPTER 4 MACHINE DEBUGGING METHODS AND STEPS

The trial run methods and steps at initial power on for this GSK980MDa are described in this chapter. The corresponding operation can be performed after the debugging by the following steps.

### 4.1 Emergency Stop and Stroke Limit

This GSK980MDa system has software limit function, it is suggested that the stroke limit switches are fixed in the positive or negative axes for hardware limit. The connection is shown in follows: (The chart is designed for $\mathrm{X}, \mathrm{Y}, \mathrm{Z}$ axes)

Fig. 4-1

So the MESP of bit parameter No.17should be set to 0 .
And the CNC diagnostic message ESP can monitor the state of emergency stop input signal.
In Manual or MPG mode, slowly move the axes to test the validity of stroke limit switch, correctness of alarm display, validity of overtravel release button. When the overtravel occurs or Emergency Stop button is pressed,"emergency stop" alarm will be issued by CNC system. The alarm can be cancelled by pressing down the Overtravel button and moving reversely.

### 4.2 Drive unit Unit Setting

Set BIT4~BIT0 of bit parameter No. 009 according to alarm logic level of drive unit. The BIT4~ BIT0 of bit parameter No. 009 for our drive unit are all set for 1 .

If the machine moving direction is not consistent with the moving command, modify the BIT4~BITO of bit parameter No.008, BIT4~BITO of bit parameter No.019, BIT4~BITO of bit parameter No. 20.

### 4.3 Gear Ratio Adjustment

The data parameter No. 049 ~ No. 058 can be modified for electronic gear ratio adjustment to meet the different mechanical transmission ratio if the machine travel distance is not consistent with the displacement distance displayed by the CNC coordinate.

Calculation formula:

$$
\frac{C M R}{C M D}=\frac{\delta \times 360}{\alpha \times L} \times \frac{Z_{M}}{Z}
$$

CMR: command multiplier coefficient (data parameter №049, №050, №051, №052, №053)
CMD: command frequency division coefficient (data parameter №054, №055, №056, №057, №058)
$\alpha$ :: pulse volume, motor rotation angle for a pulse
L: lead
$\delta$ : min. input command unit of CNC (0.0001 for all axes of GSK980MDa)
ZM: gear teeth of lead screw
ZD: gear teeth of motor
If the electronic gear ratio numerator is greater than the denominator, the allowed CNC max. speed will decrease. For example: the data parameter No. 051 ( CMRZ ) $=2$, №056 ( CMDZ ) =1, so the allowed $Z$ axis max. speed is $8000 \mathrm{~mm} / \mathrm{min}$.

If the electronic gear ratio numerator is not equal to the denominator, the allowed CNC positioning precision will decrease. For example: when the data parameter No. 051 ( CMRZ )=1 and №056 ( CMDZ ) $=5$, the pulse is not output as the input increment is 0.004 , but a pulse is output if the input increment is up to 0.005 .

In order to ensure the CNC positioning precision, speed index and match with digit servo with electronic gear ratio function, it is suggested that the CNC electronic gear ratio is set for $1: 1$ or the electronic gear ratio calculated is set to the digital servo.

When matching with the step drive, choose the drive unit with step division function as far as possible, and properly select mechanical transmission ratio. The 1:1 electronic gear ratio should be ensured to avoid the too large difference between the numerator and the denominator of this CNC gear ratio.

## Example:

Match GSK980MDa with DA98B, take X axis for example: set command multiplier coefficient and command frequency division coefficient to 1 . Calculation formula is shown below.

CNC:

$$
\frac{C M R}{C M D}=\frac{\delta \times 360}{\alpha \times L} \times \frac{Z_{M}}{Z_{D}}=\frac{1}{1}
$$

The following conclusions can be reached:

Drive unit:

$$
\alpha=\frac{\delta \times 360}{\mathrm{~L}} \times \frac{\mathrm{Z}_{\mathrm{M}}}{\mathrm{Z}_{\mathrm{D}}}(\text { deg } / \text { pulse })
$$

Parameters 12, 13 of drive unit correspond to position command pulse frequency division
molecule and denominator. Calculation formula of drive unit gear ratio is shown as follows:

$$
P \times G=4 \times N \times C
$$

P: Correspondence between required pulse volume for motor rotates 3600 and CNC end: $P=360 / \alpha$

G: Electronic gear ratio of drive unit, $\mathrm{G}=$ position command pulse frequency division molecule/ position command pulse frequency division denominator

N : Set motor rev number to 1
C: Wire number of feedback encoder: DA98B is $2500 \mathrm{p} / \mathrm{r}$.

The following conclusions can be reached:

$$
\begin{aligned}
& G=\frac{4 \times N \times C}{P}=4 \times N \times C \times \frac{\alpha}{360}=\frac{4 \times N \times C}{360} \times \frac{\delta \times 360}{L} \times \frac{Z_{M}}{Z_{D}}= \\
& =\frac{10 \times Z_{M}}{L \times Z_{D}}
\end{aligned}
$$

Set molecule and denominator of caculated ratio to drive unit 12, 13 separately.

### 4.4 Acceleration\&deceleration Characteristic Adjustment

Adjust the relative CNC parameters according to the factors such as the drive unit, motor characteristics and machine load:

Data parameter №059 ~№063: X, Y, Z, 4th, 5th axis rapid traverse rate;
Data parameter №064~№068: linear acceleration \& deceleration time constant of X , Y, Z, 4th, 5th axis rapid traverse rate;

Data parameter №069: rapid traverse speed when rapid override is F0
Data parameter №070: upper limit of axes cutting feedrate;
Data parameter №071: Start/end speed of exponential acceleration \& deceleration in cutting feeding;

Data parameter №072: Exponential acceleration \& deceleration time constant of cutting feeding;
Data parameter№073: Start/end speed of exponential acceleration \& deceleration in MPG/Step feedrate;

Data parameter№074 : Exponential acceleration \& deceleration time constant of MPG/STEP/manual feed;

Data parameter№075: Start/end speed in thread cutting of each ax;
Data parameter№077: Initial feedrate of acc.\&dec in CS axis;
Data parameter№078: Acc.\&dec.time constant in CS axis;
Data parameter№081: Initial speed of linear acceleration/deceleration in rigid tapping;
Data parameter№082: Linear acceleration/deceleration time constant in rigid tapping tool infeed;
Data parameter№083: Linear acceleration/deceleration time constant in rigid tapping tool retraction;

Data parameter№084: Override value in rigid tapping tool retract;
Data parameter№172: Initial feedrate when power on;
Data parameter№174: Feedrate of DRY run;
SMZ of bit parameter №007: for validity of smoothing transition between blocks

The larger the acceleration\&deceleration time constant is, the slower tacceleration\&deceleration is, the smaller the machine movement impact and the lower the machining efficiency is.And vice versa.

If acceleration\&deceleration time constants are equal, the higher the acceleration \& deceleration start/end speed is, the faster the acceleration \& deceleration is, the bigger the machine movement impact and the higher the machining efficiency is. And vice versa.

The principle for acceleration\&deceleration characteristicadjustment is to properly reduce the acceleration \& deceleration time constant and increase the acceleration\&deceleration start/end speed to improve the machining efficiency on the condition that there is no alarm, motor out-of-step and obvious machine impact. If the acceleration\&deceleration time constant is set too small, and the start/end speed is set too large, it is easily to cause drive unit alarm, motor out-of-step or machine vibration.

When the bit parameter №007 BIT3 ( SMZ ) =1, the feedrate drops to the start speed of the acceleration\&deceleration at the cutting path intersection, then it accelerates to the specified speed of the adjacent block to obtain an accurate positioning at the path intersection, but this will reduce the machining efficiency. When SMZ=0, the adjacent cutting path transits smoothly by the acceleration\&deceleration. The feedrate does not always drop to the start speed when the previous path is finished and a circular transition (non-accurate positioning) will be formed at the path intersection. The machining surface by this path transition has a good finish and a higher machining efficiency. When the stepper motor drive unit is applied, the SMZ of the bit parameter №007 should be set to 1 to avoid the out-of-step.

When the stepper motor drive unit is applied to this system, the out-of-step may occur if rapid traverse speed is too large, acceleration\&deceleration time constant is too small, acceleration\&deceleration start/end speed is too large. The suggested parameter setting is shown in follows (the electronic gear ratio is 1:1):

Data parameter №059~№063 5000 Data parameter №064~№068 350 Data parameter №071 50

Data parameter №072 $\geq 150$ Data parameter №073 $\leq 50$ Data parameter№074 $\mathbf{1 5 0}$
Data parameter№075 $\leq 100$

When AC servo motor drive unit is applied to this system, the machining efficiency can be improved by a larger start speed and smaller ACC\&DEC time constant setting. If optimum ACC\&DEC characteristics are required, the ACC\&DEC time constant may be set to 0 , which can be got by adjusting the AC servo ACC\&DEC parameters. The suggested parameter settings are as follows (electronic gear ratio is $1: 1$ ).

Data parameter №059~№063 set higher properly
Data parameter №064~№068ธ60
Data parameter №071 $\mathbf{5 0}$
Data parameter №072 $\leq 50$
Data parameter №073 250
Data parameter №074 50
Data parameter №075 500
The parameter settings above are recommended for use, refer to the actual conditions of the drive unit, motor characteristic and machine load for its proper setting.

### 4.5 Machine Zero Adjustment

Adjust the relevant parameters based on the valid level of the connection signal, zero return type or direction applied:
( DECI ) of the bit parameter №004: valid level of deceleration signal as machine zero return (ZM5~ZMX) of the bit parameter №006: return and initial backlash direction of $\mathrm{X}, \mathrm{Y}, \mathrm{Z}, 4$ 4th, 5th axes machine zeroes at deceleration.
(ZC5~ZCX) of the bit parameter №007: it is able to set whether an approach switch taken as both deceleration and zero signals when $X, Y, Z, 4$ th, $5^{\text {th }}$ axes return to machine zero point.
(ZNLK) of the bit parameter №011: for direction keys lock when performing zero return
(ZRS5~ZRSX) of the bit parameter №014: for deceleration and zero signals detection of $\mathrm{X}, \mathrm{Y}, \mathrm{Z}$ axes in machine zero return.
( MZR5~MZRX) of the bit parameter №22: for positive or negative zero turn of $X, Y, Z, 4$ th, 5 th axes

Data parameter №089~№093: low speed of X, Y, Z, 4th, 5th axes in machine zero return Data parameter №094~№098: high speed of X, Y, Z, 4th, 5th axes in machine zero return
RRT4 of bit parameter №027 and RRT5 of №029 set the machine zero return type of the 4th and the 5th axis separately.

Machine zero return can be done after the validity of overtravel limit swithch is confirmed.Machine zero return types A, B, C can be selected for basic axes ( $\mathrm{X}, \mathrm{Y}, \mathrm{Z}$ ). Machine zero return types A, B, C, D can be selected for additional axes (4th, 5th).

The machine zero is usually fixed at the max. travel point, and the effective stoke of the zero return touch block should be more than 25 mm to ensure a sufficient deceleration distance for accurate zero return. The more rapid the machine zero return is, the longer the zero return touch block should be. Or the moving carriage will rush through the block which may influence the zero return precision because of the insufficient deceleration distance.

Usually there are 2 types of machine zero return connection:
1 The connection to AC servo motor: schematic diagram of using a travel switch and a servo motor one-rotation signal separately

Fig. 4-2

By this connection type, when the deceleration switch is released in machine zero return, the one-rotation signal of encoder should be avoided to be at a critical point after the travel switch is released.In order to improve the zero return precision, it should be ensured the motor reaches the one-rotation signal of encoder after it rotates for half circle.And the moving distance for motor half circle rotation is the motor gear teeth/( $2 \times$ lead screw gear teeth)

2 The connection to stepper motor: the schematic diagram of using a proximity switch taken as both deceleration signal and zero signal

Fig 4-3

### 4.6 Spindle Adjustment

### 4.6.1 Spindle encoder

Encoder with the linear number $100 \sim 5000 \mathrm{p} / \mathrm{r}$ is needed to be installed on the machine for threading. The linear number is set by data parameter No.109. The transmission ratio(spindle gear teeth/encoder gear teeth) between encoder and spindle is $1 / 255 \sim 255$. The spindle gear teeth are set by CNC data parameter No.110, and the encoder gear teethare set by data parameter No.111. Synchronous belt transmission should be applied for it (no sliding transmission).

The DGN. 011 and DNG. 012 of CNC diagnosis messages are used to check the validity of threading signal from the spindle encoder.

### 4.6.2 Spindle brake

After spindle stop is executed, proper spindle brake time should be set to stop the spindle promptly in order to enhance the machining efficiency. If the brake is employed with energy consumption type, too long braking time may damage the motor. So the brake time is set by PLC.
